# Définitions

- **Système climatique:** constitué par l'atmosphère, les océans, la cryosphère (glace), la surface des continents, la biosphère...
- **Le climat** = moyenne de l'état de ce système, en particulier du temps sur 30 ans, + variabilité autour de cette moyenne

# Le système climatique terrestre

- Machine thermique alimentée en énergie par le Soleil ( $1400 \text{ Wm}^{-2}$  au sommet de l'atmosphère)
- « Sphère » en rotation : dynamique des fluides complexe
- Océan= 70% de la surface,
- Très fine atmosphère ( $\text{N}_2$ ,  $\text{O}_2$ ,  $\text{H}_2\text{O}$ ,  $\text{CO}_2$ ,...)
- Effet de serre
- Cycles bio-géo-chimiques

# Température moyenne planétaire observée en surface (continent + océan)

# Temperature spiral

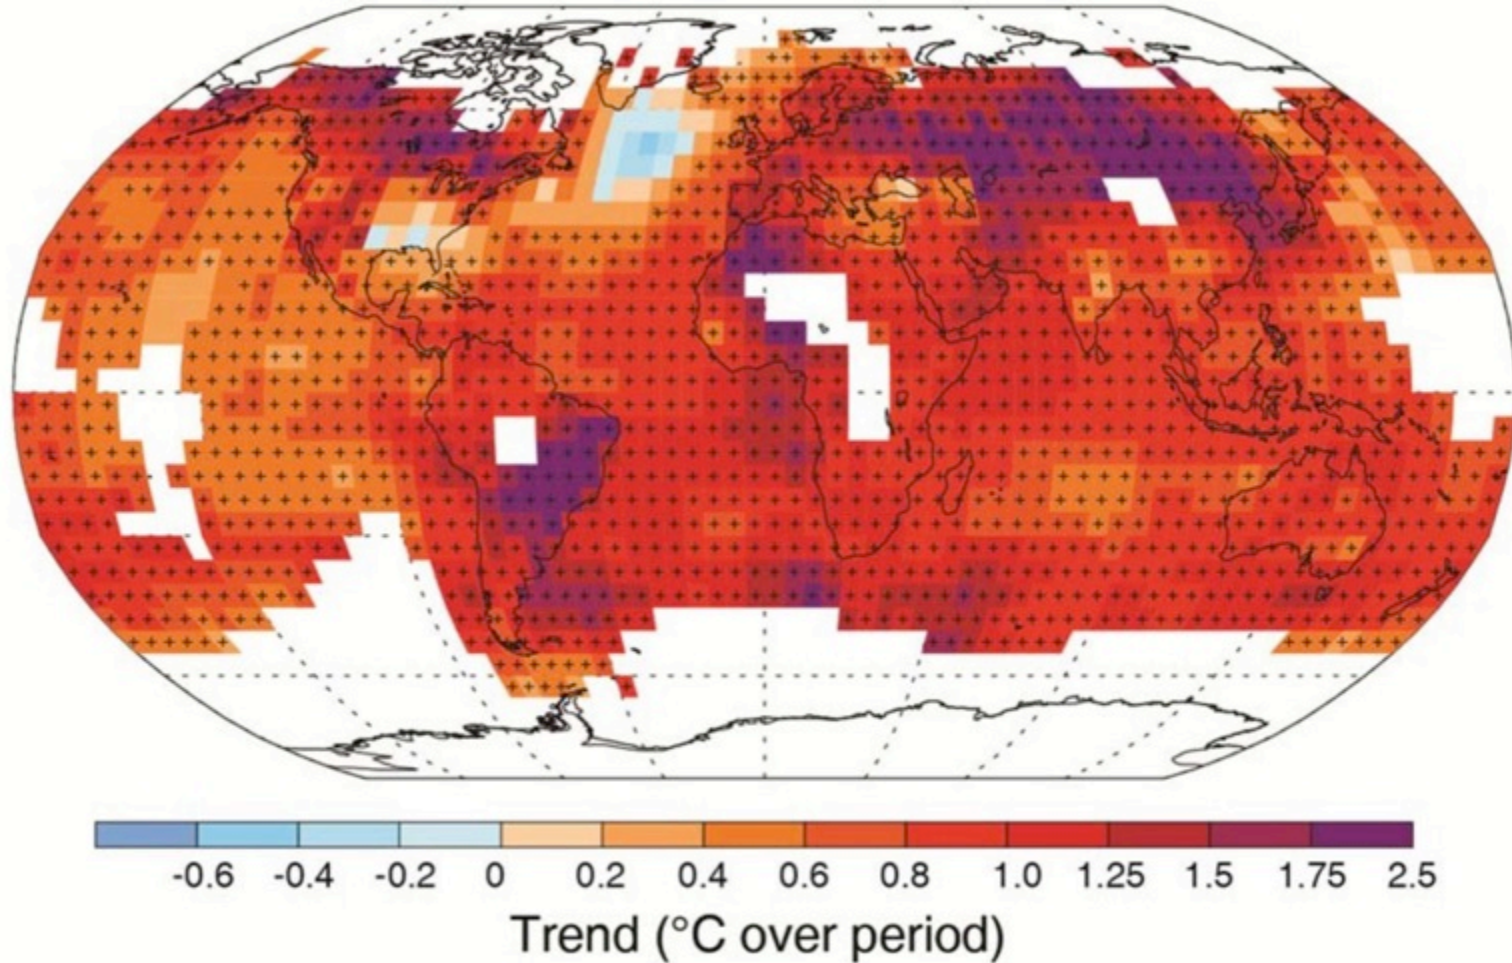

Global Mean Temperature in °C relative to 1850 – 1900

Graph: Ed Hawkins (Climate Lab Book) – Data: HadCRUT4 global temperature dataset

Available on <http://openclimatedata.net/climate-spirals/temperature>

# Evolution de la température moyenne en surface 1901-2012: +0.89°C

Le réchauffement du système climatique est sans équivoque

# Résumé (1)

- $C + O_2 = \text{chaleur} + CO_2$  (inévitabile)
- 80% de d'énergie mondiale viennent des combustibles fossiles, contenant du "C" (carbone); le déboisement contribue aussi à l'émission de  $CO_2$
- Ce gaz "à effet de serre" piège la chaleur
- De façon simplifiée : actuellement la moitié du  $CO_2$  émis reste environ 100 ans dans l'atmosphère; il s'y accumule:  $[CO_2] +40\%$  depuis 1750

## Résumé (2)

- La température globale augmente (déjà  $0.85^{\circ}\text{C}$  de 1880 à 2012) & augmentera ( $+0.3$  à  $+4.8^{\circ}\text{C}$  de  $\approx 1995$  à  $\approx 2090$ ; gamme « probable » de l'AR5)
- Des impacts importants sont attendus
- Limiter l'augmentation de température à  $+2^{\circ}\text{C}$   
(// pré-industriel)  
= réduire les émissions mondiales nettes à  $\approx 0 < 2100!$

**THE HUMAN INFLUENCE ON ATMOSPHERE & CLIMATE**  
(IPCC/WG1: Climate Change 2001, SPM & Chapters 2, 3, 4, 5, 9)

Caution: these numbers are based on different scenarios & assumptions

# Change in average sea-level change

# GIEC : Groupe d'experts Intergouvernemental sur l'Evolution du Climat (=IPCC en anglais)

- Créé par l'OMM et le PNUE en 1988 (rés. Nat. Unies 43/53)
- Mandat : évaluer les informations scientifiques, techniques et socio-économiques liées à la compréhension des risques associés aux changements climatiques et aux options de réponse (base scientifique, impacts potentiels, prévention et adaptation)
- Membres : pays membres des Nations Unies et de l'OMM
- Des milliers de scientifiques contribuent aux rapports
  - ✦ Principal produit : « rapports d'évaluation » (1990, 1996, 2001, 2007, 2013-14) (Cambridge University Press)
- Web: [www.ipcc.ch](http://www.ipcc.ch) voir notamment le document « Understanding climate change, 22 years of IPCC assessment », IPCC, Novembre 2010

WG I (Physical science basis): 209 lead authors, 2014 pages, 54.677 review comments

WG II (Impacts, Adaptation and Vulnerability): 243 lead authors, 2000 pages, 50.492 review comments

WG III (Mitigation of Climate Change): 235 coordinating and lead authors, 2000 pages, 38.315 review comments

- Safeguarding the Ozone Layer and the Global Climate System (2005)
- Methodological and Technological Issues in Technology Transfer (2000)
- Emissions Scenarios (SRES, 2000)

# Discovery of the Greenhouse Effect

## Joseph Fourier (1827)

Recognized that gases in the atmosphere might trap the heat received from the Sun.

## John Tyndall (1859)

Careful laboratory experiments demonstrated that several gases could trap infrared radiation. The most important was simple water vapor. Also effective was carbon dioxide, although in the atmosphere the gas is only a few parts in ten thousand.

## Svante Arrhenius (1896)

Performed numerical calculations that suggested that doubling the amount of carbon dioxide in the atmosphere could raise global mean surface temperatures by 5-6°C.  
(not reliable yet : errors & lack of appropriate data)

## Guy Callendar (1939)

Argued that rising levels of carbon dioxide were responsible for measurable increases in Earth surface temperatures. Estimated that doubling the amount of CO<sub>2</sub> in the atmosphere could raise global mean surface temperatures by 2°C.

# A Progression of Understanding: Greater and Greater Certainty in Attribution

AR1 (1990):  
“unequivocal detection  
not likely for a decade”

AR2 (1995): “balance of  
evidence suggests  
**discernible** human  
influence”

AR3 (2001): “most of  
the warming of the  
past 50 years is **likely**  
(odds 2 out of 3) due  
to human activities”

AR4 (2007): “most of  
the warming is **very  
likely** (odds 9 out of 10)  
due to greenhouse  
gases”

**Blue:** Simulation with natural factors only

**Red:** Simulations with both human & natural factors

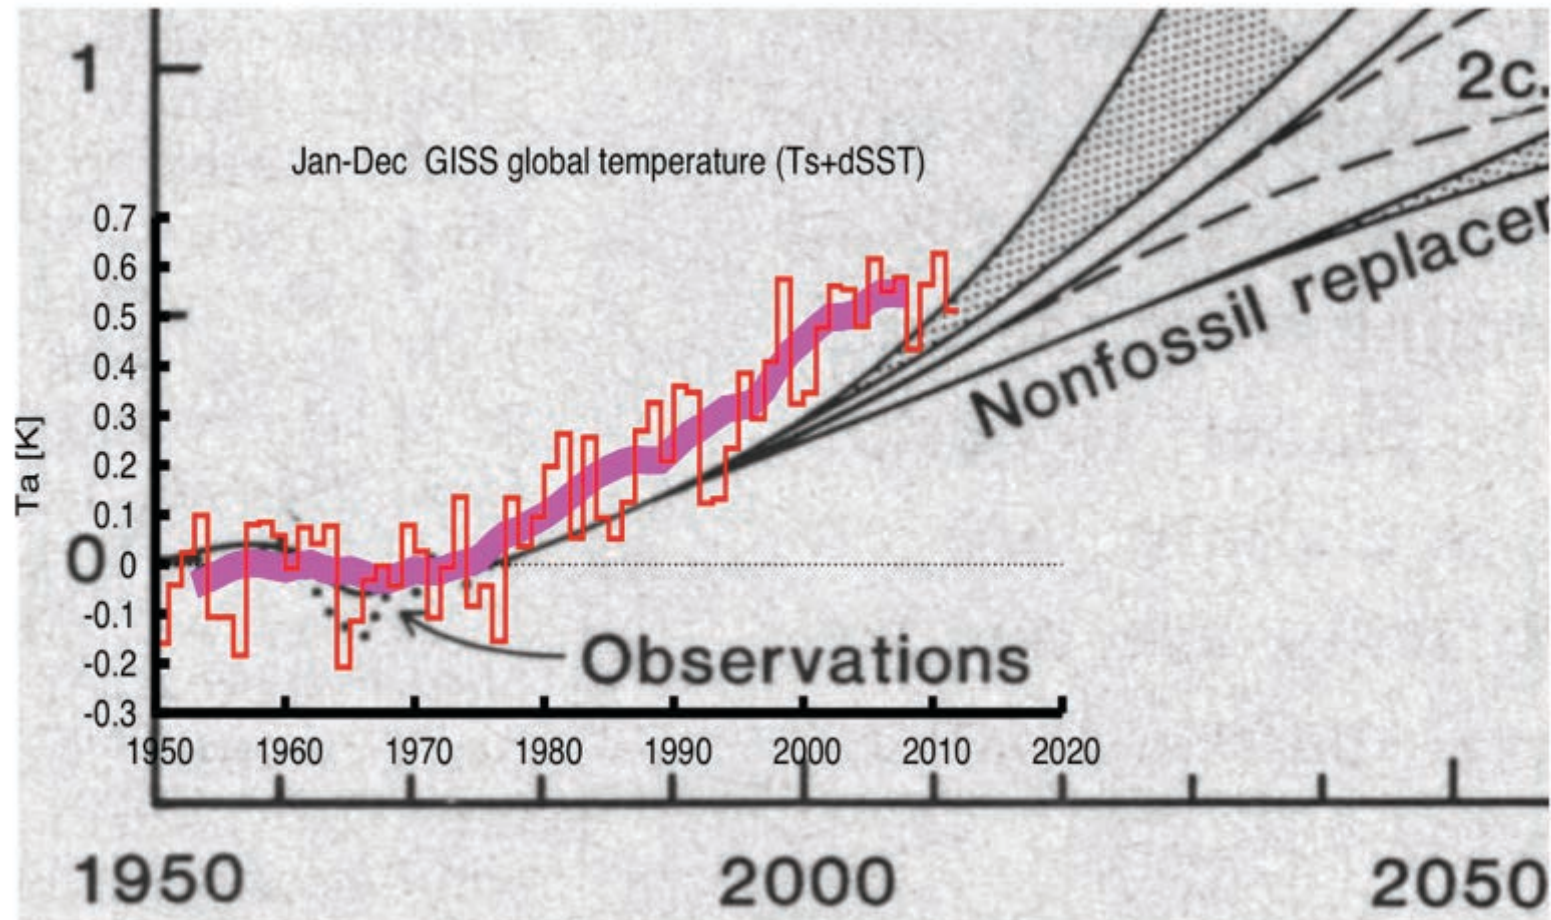

AR5 (2013) «It is **extremely likely**  
(odds 95 out of 100) that human influence  
has been the dominant cause... »

# Que disaient les modèles climatiques, il y a presque 40 ans ?

Fig. 6. Projections of global temperature. The diffusion coefficient beneath the ocean mixed layer is  $1.2 \text{ cm}^2 \text{ sec}^{-1}$ , as required for best fit of the model and observations for the period 1880 to 1978. Estimated global mean warming in earlier warm periods is indicated on the right.

# Les résultats des modèles sont proches de la réalité

# AR5 RCP: Atmospheric CO<sub>2</sub> concentration

Most CMIP5 runs are based on the concentrations, but emissions-driven runs are available for RCP 8.5

Note : « emission-driven » -> knowledge of C-cycle uncertainty

# Compatible fossil fuel emissions simulated by the CMIP5 models for the four RCP scenarios (détail)

Les traits pleins donnent les émissions qu'il faudrait mettre dans les modèles climatiques complexes pour obtenir la concentration de chaque RCP, en comparaison des émissions associées à chaque RCP par les modèles simples

# Réchauffement moyen – scén. RCP, 2Is

# Global mean surface temperature change projections

Increase over 21st century, from 1986-2005 to 2081-2100

	mean	likely range
RCP2.6	1.0 (°C)	0.3 to 1.7 (°C)
RCP4.5	1.8	1.1 to 2.6
RCP6	2.2	1.4 to 3.1
RCP8.5	3.7	2.6 to 4.8

For 1850-1900 reference : add +0.61 [0.55 to 0.67] °C

Source : AR5 WGI SPM. Note : résultats de modèles très proches AR4

# RCP2.6

# RCP8.5

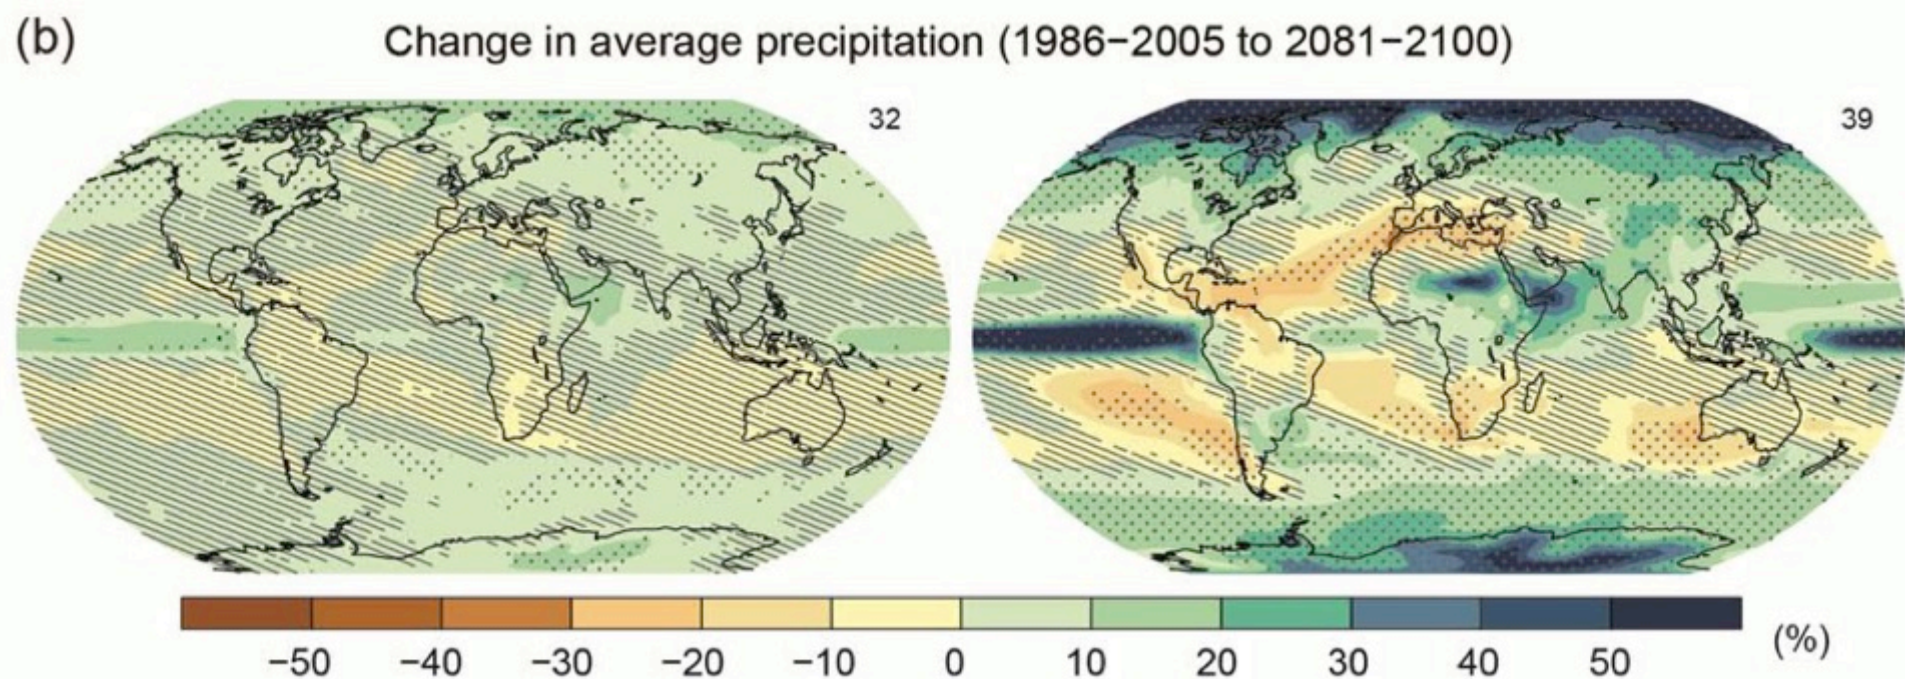

Change in average surface temperature (1986–2005 to 2081–2100)

**Hatching [hachures] indicates regions where the multi-model mean is small compared to natural internal variability (i.e., less than one standard deviation of natural internal variability in 20-year means).**

**Stippling [pointillés] indicates regions where the multi-model mean is large compared to natural internal variability (i.e., greater than two standard deviations of natural internal variability in 20-year means) and where at least 90% of models agree on the sign of change**

# Projected Change in Precipitation

**Hatching** indicates regions where *the multi-model mean is small compared to natural internal variability* (i.e., less than one standard deviation of natural internal variability in 20-year means).  
**Stippling** indicates regions where the multi-model mean is large compared to natural internal variability (i.e., greater than two standard deviations of natural internal variability in 20-year means) and where at least 90% of models agree on the sign of change

# Extreme weather and climate events

Phenomenon and direction of trend	Assessment that changes occurred (typically since 1950 unless otherwise indicated)	Assessment of a human contribution to observed changes	Likelihood of further changes	
			Early 21st century	Late 21st century
Warmer and/or fewer cold days and nights over most land areas	<i>Very likely</i>	<b>Very likely</b>	<i>Likely</i>	<b>Virtually certain</b>
Warmer and/or more frequent hot days and nights over most land areas	<i>Very likely</i>	<b>Very likely</b>	<i>Likely</i>	<b>Virtually certain</b>
Warm spells/heat waves. Frequency and/or duration increases over most land areas	<b>Medium confidence</b> on a global scale Likely in large parts of Europe, Asia and Australia	<b>Likely</b>	Not formally assessed	<b>Very likely</b>
Heavy precipitation events. Increase in the frequency, intensity, and/or amount of heavy precipitation	<i>Likely more land areas with increases than decreases</i>	<b>Medium confidence</b>	<i>Likely over many land areas</i>	<b>Very likely</b> over most of the mid-latitude land masses and over wet tropical regions
Increases in intensity and/or duration of drought	<b>Low confidence</b> on a global scale Likely changes in some regions	<b>Low confidence</b>	<i>Low confidence</i>	<b>Likely (medium confidence)</b> on a regional to global scale
Increases in intense tropical cyclone activity	<b>Low confidence</b> in long term (centennial) changes Virtually certain in North Atlantic since 1970	<b>Low confidence</b>	<i>Low confidence</i>	<b>More likely than not</b> in the Western North Pacific and North Atlantic
Increased incidence and/or magnitude of extreme high sea level	<i>Likely (since 1970)</i>	<b>Likely</b>	<i>Likely</i>	<b>Very likely</b>

IPCC, AR5,  
Table SPM.1

Fig. SPM.9

RCP2.6 (2081-2100), *likely* range: 26 to 55 cm

RCP8.5 (in 2100), *likely* range: 52 to 98 cm

## Ocean Acidification, for RCP 8.5 (orange) & RCP2.6 (blue)

# Oceans are Acidifying Fast .....

## Changes in pH over the last 25 million years

“Today is a rare event in the history of the World”

- It is happening now, at a **speed and to a level** not experienced by marine organisms for about 60 million years
- Mass extinctions linked to previous ocean acidification events
- Takes 10,000's of years to recover

Turley et al. 2006

Slide courtesy of Carol Turley, PML

# Principales sources d'incertitudes

- **Microphysique des nuages**
- **Effets radiatifs des aérosols**
- **Interactions biosphère-atmosphère**
- **Stabilité de la circulation océanique**
- **Stabilité des calottes glaciaires**
- **Distribution des effets sur les pluies**
- **Fréquence & intensité des événements extrêmes (en partie)**

# Principales « certitudes »

- **Les gaz à effet de serre d'origine humaine vont continuer à réchauffer le climat global**
- **Même les modèles « optimistes » montrent un réchauffement sans précédent au cours des 10.000 dernières années**
- **L'inertie du système est grande, en particulier pour le niveau des mers**
- **La stabilisation du climat requiert d'importantes réductions des émissions.**
