About the next IPCC Special Report :

Global warming of 1.5°C

(…) in the context of strengthening the global response to the threat of climate change, sustainable development, and efforts to eradicate poverty

Jean-Pascal van Ypersele

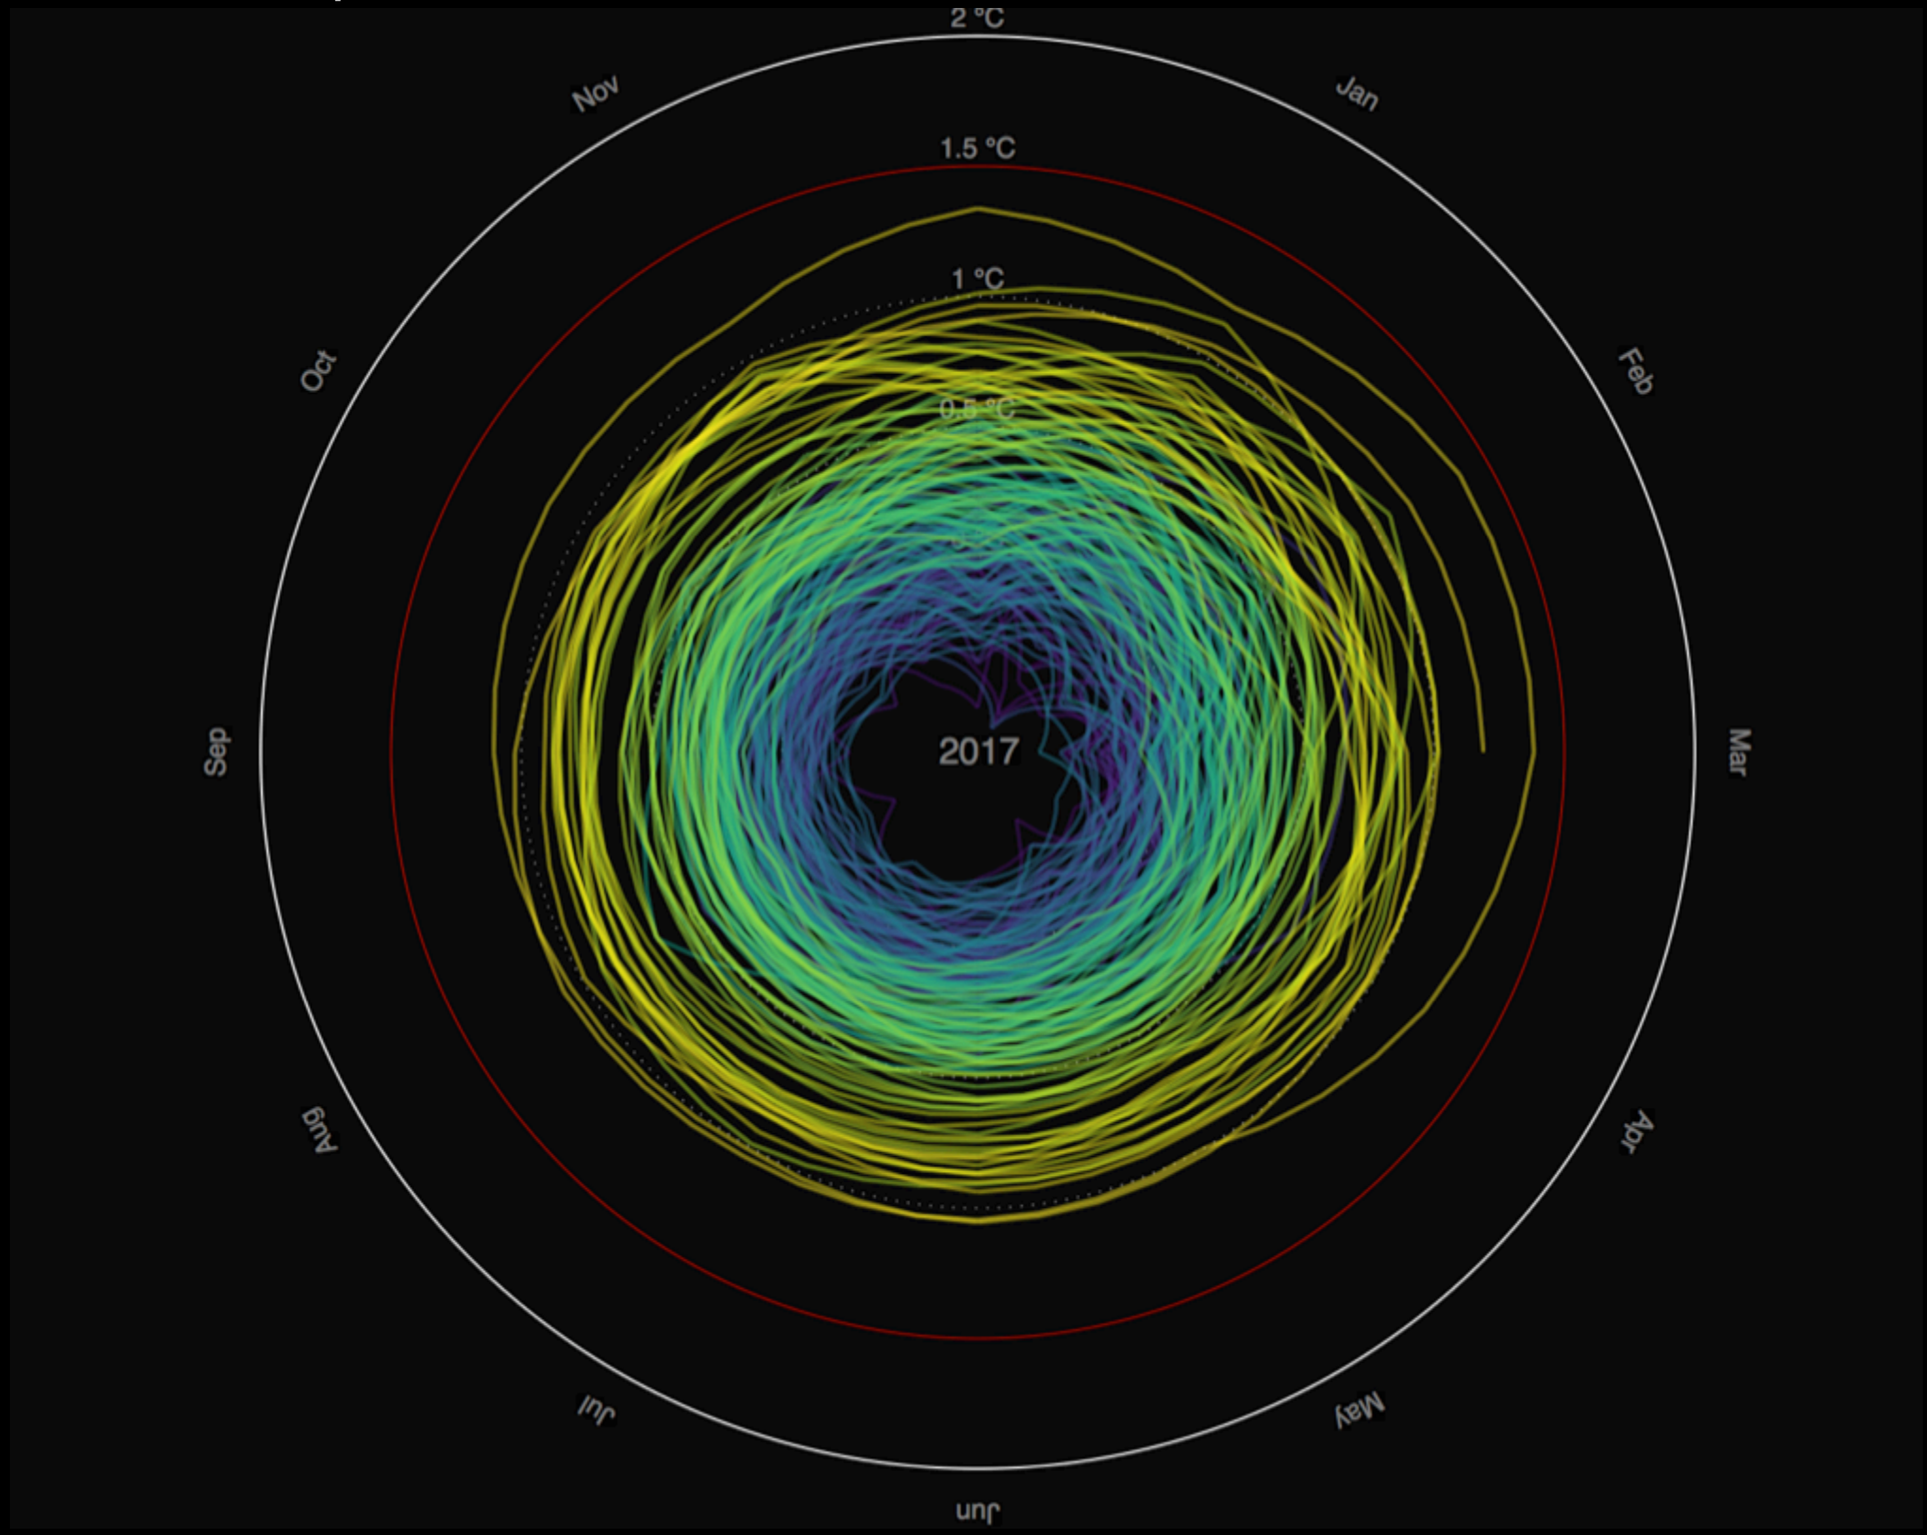
Université catholique de Louvain (Belgium)

Former IPCC Vice-Chair (2008-2015)

Brussels (CAN-Europe), 19 April 2018

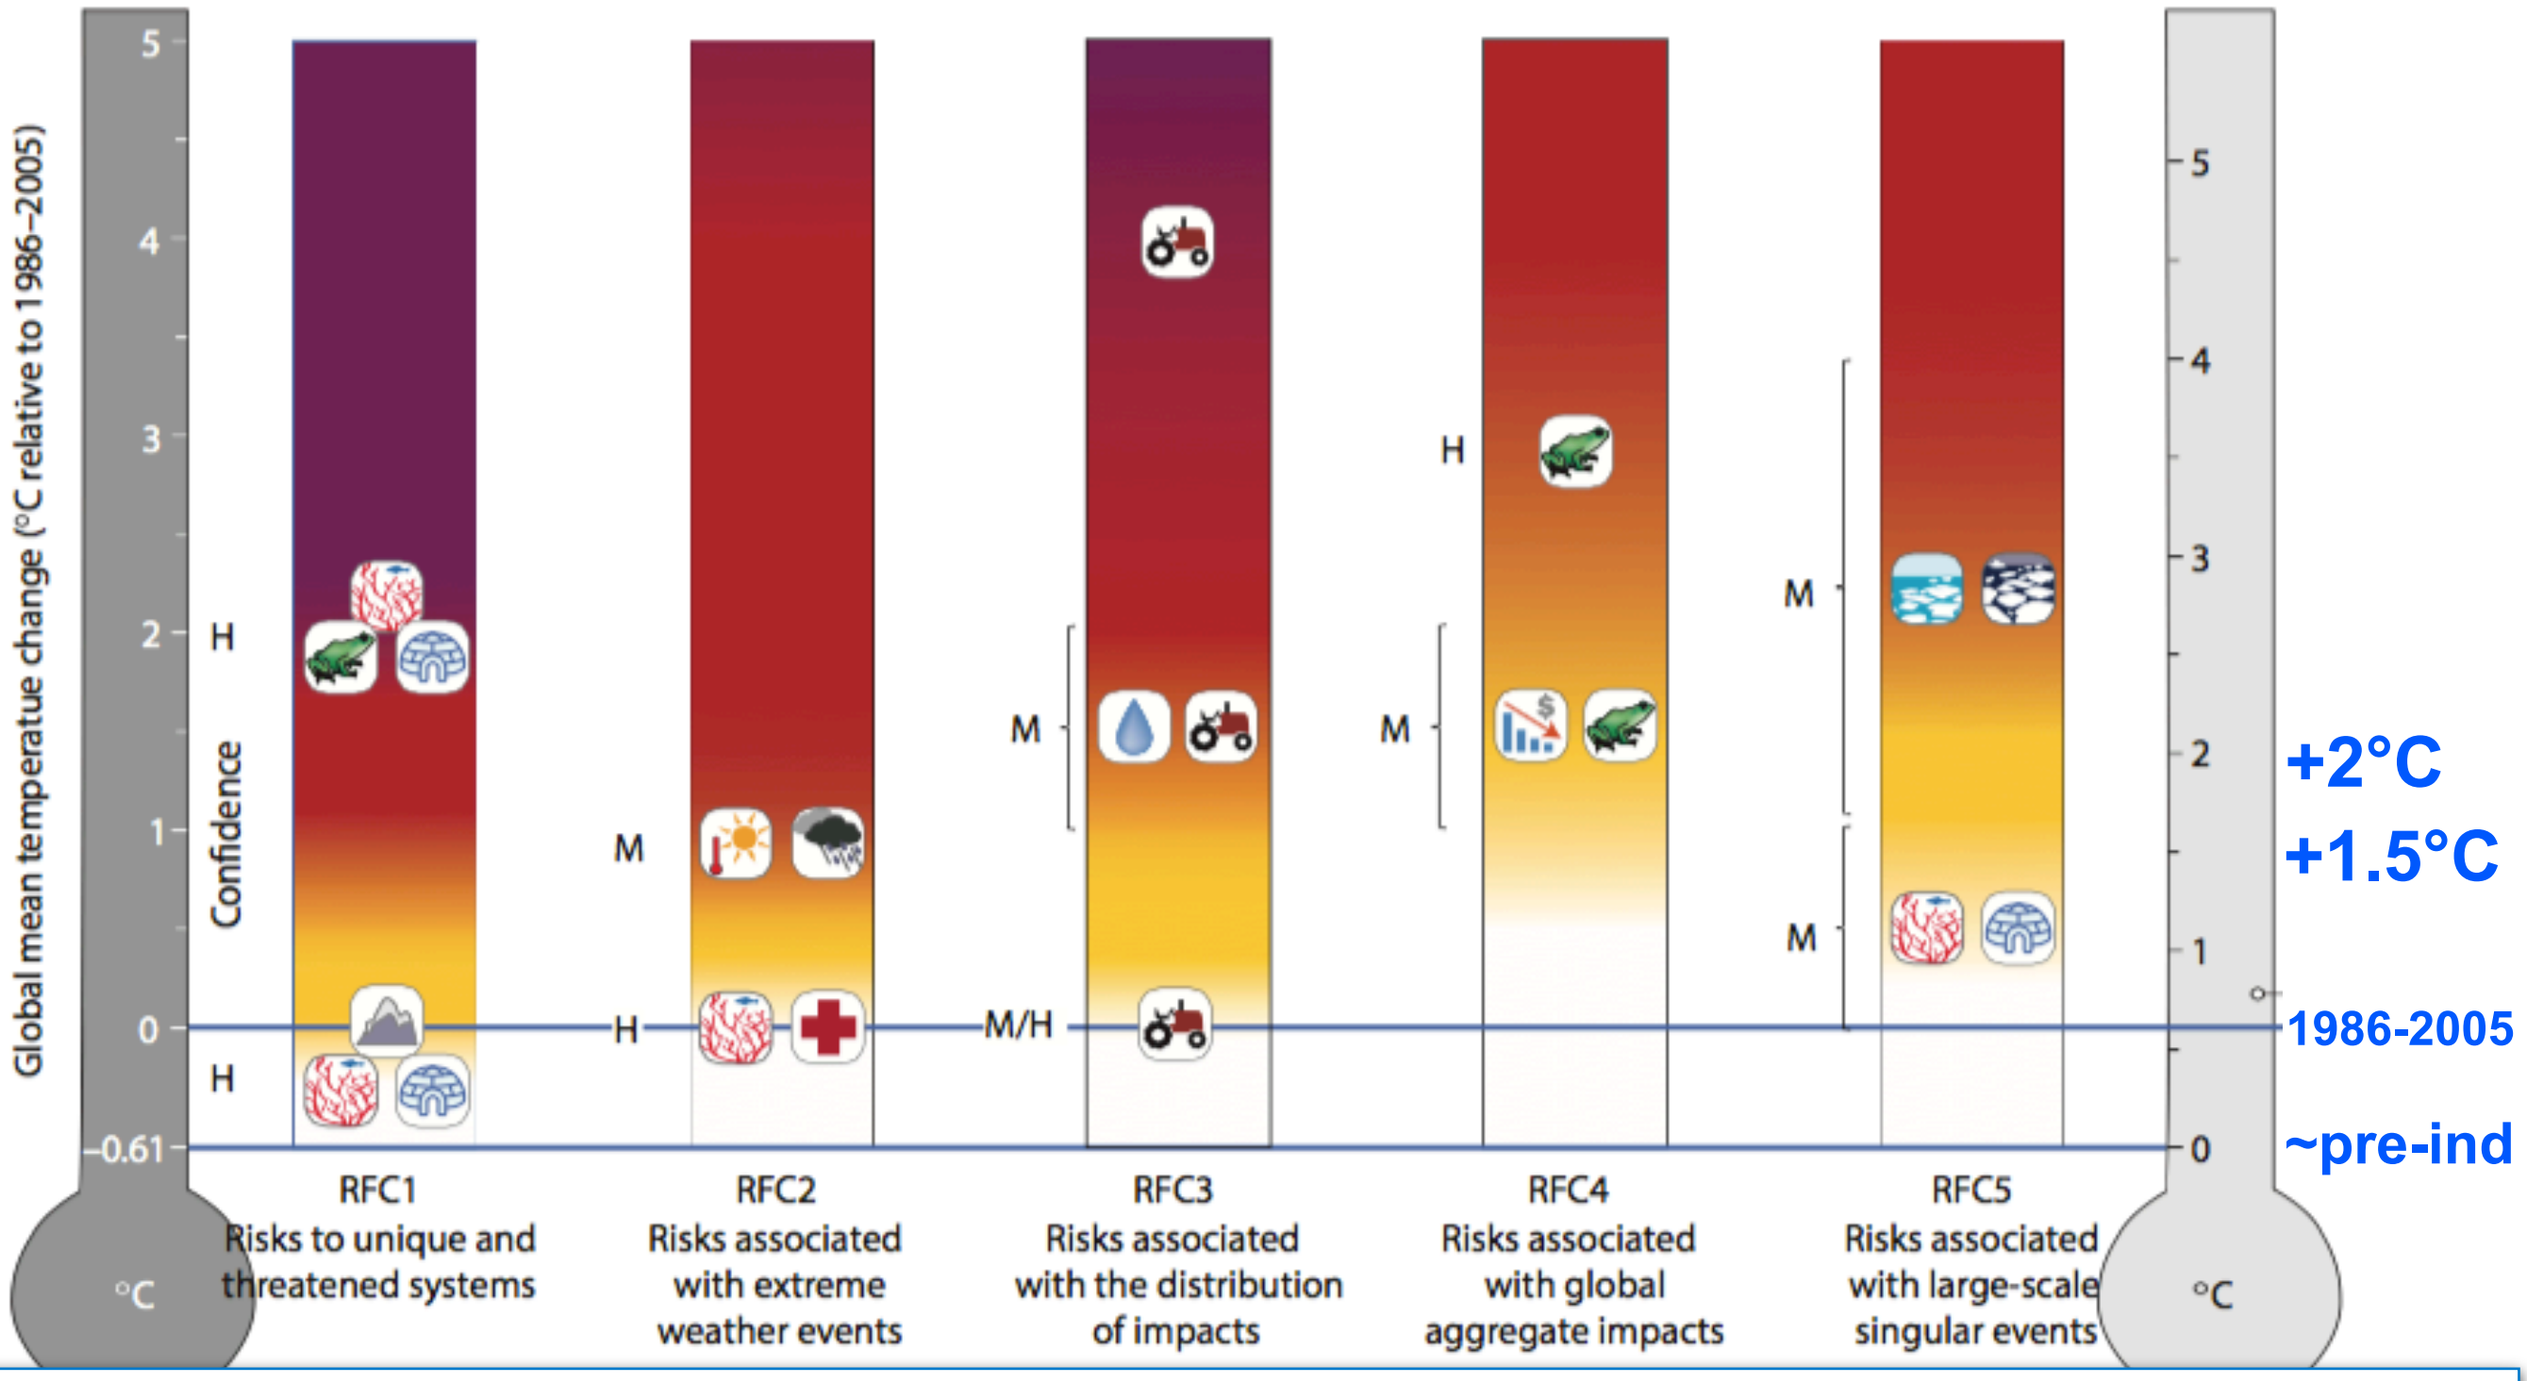
Thanks to the Walloon government (funding the Walloon Platform for IPCC) for its support

Temperature spiral

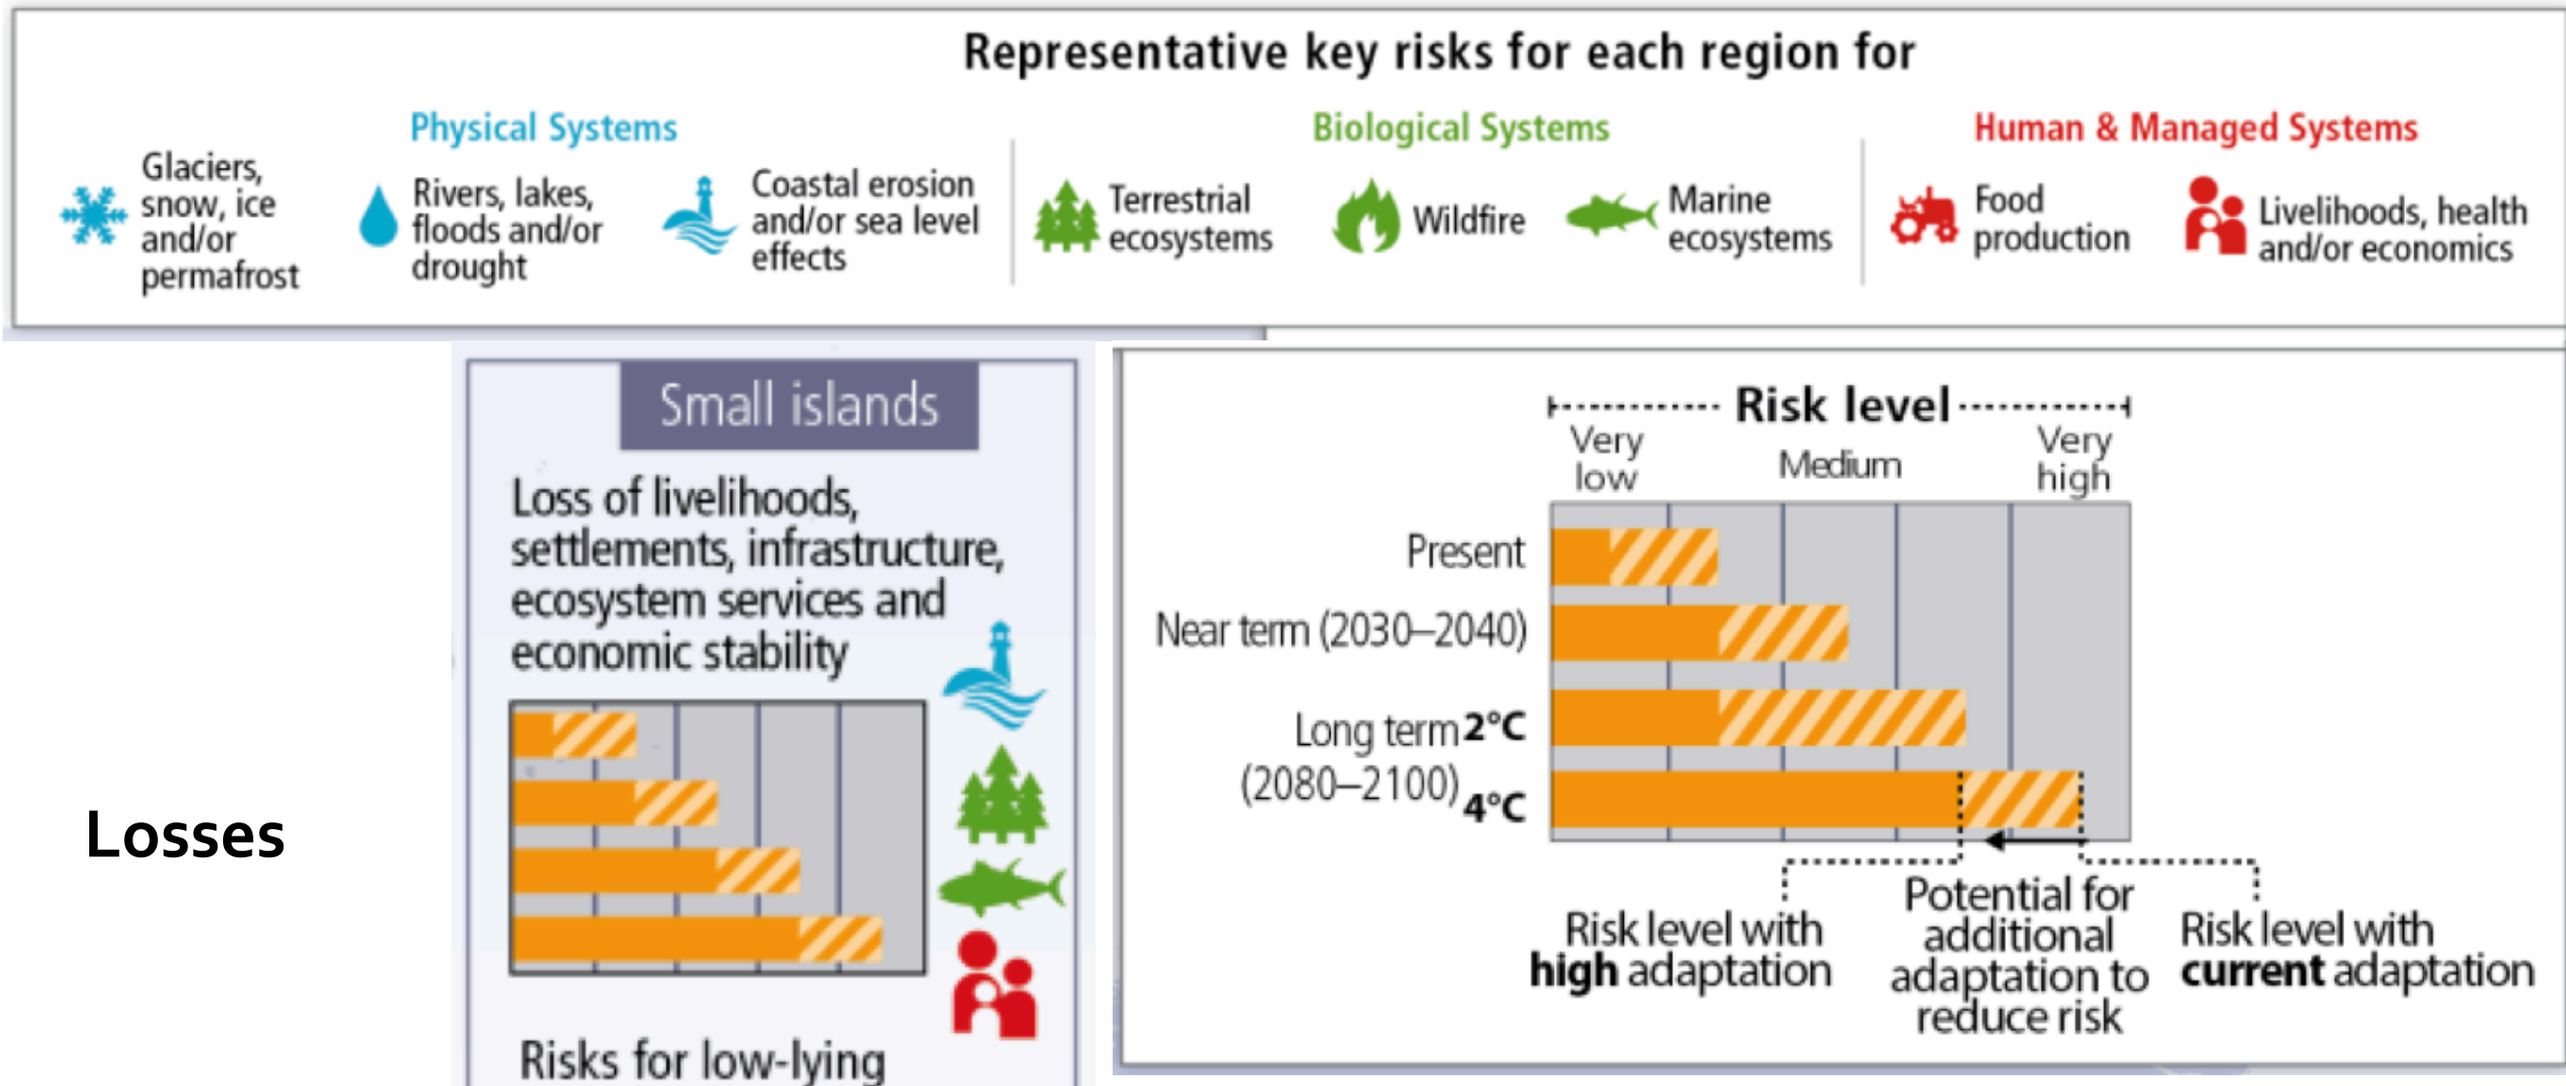


Global Mean Temperature in °C relative to 1850 – 1900
Graph: Ed Hawkins (Climate Lab Book) – Data: HadCRUT4 global temperature dataset
Animated version available on http://openclimatedata.net/climate-spirals/temperature

IPCC reasons for concern / climate change risks
(O'Neill et al., Nat Climate Change 2017)



Regional key risks and potential for risk reduction: Small Islands



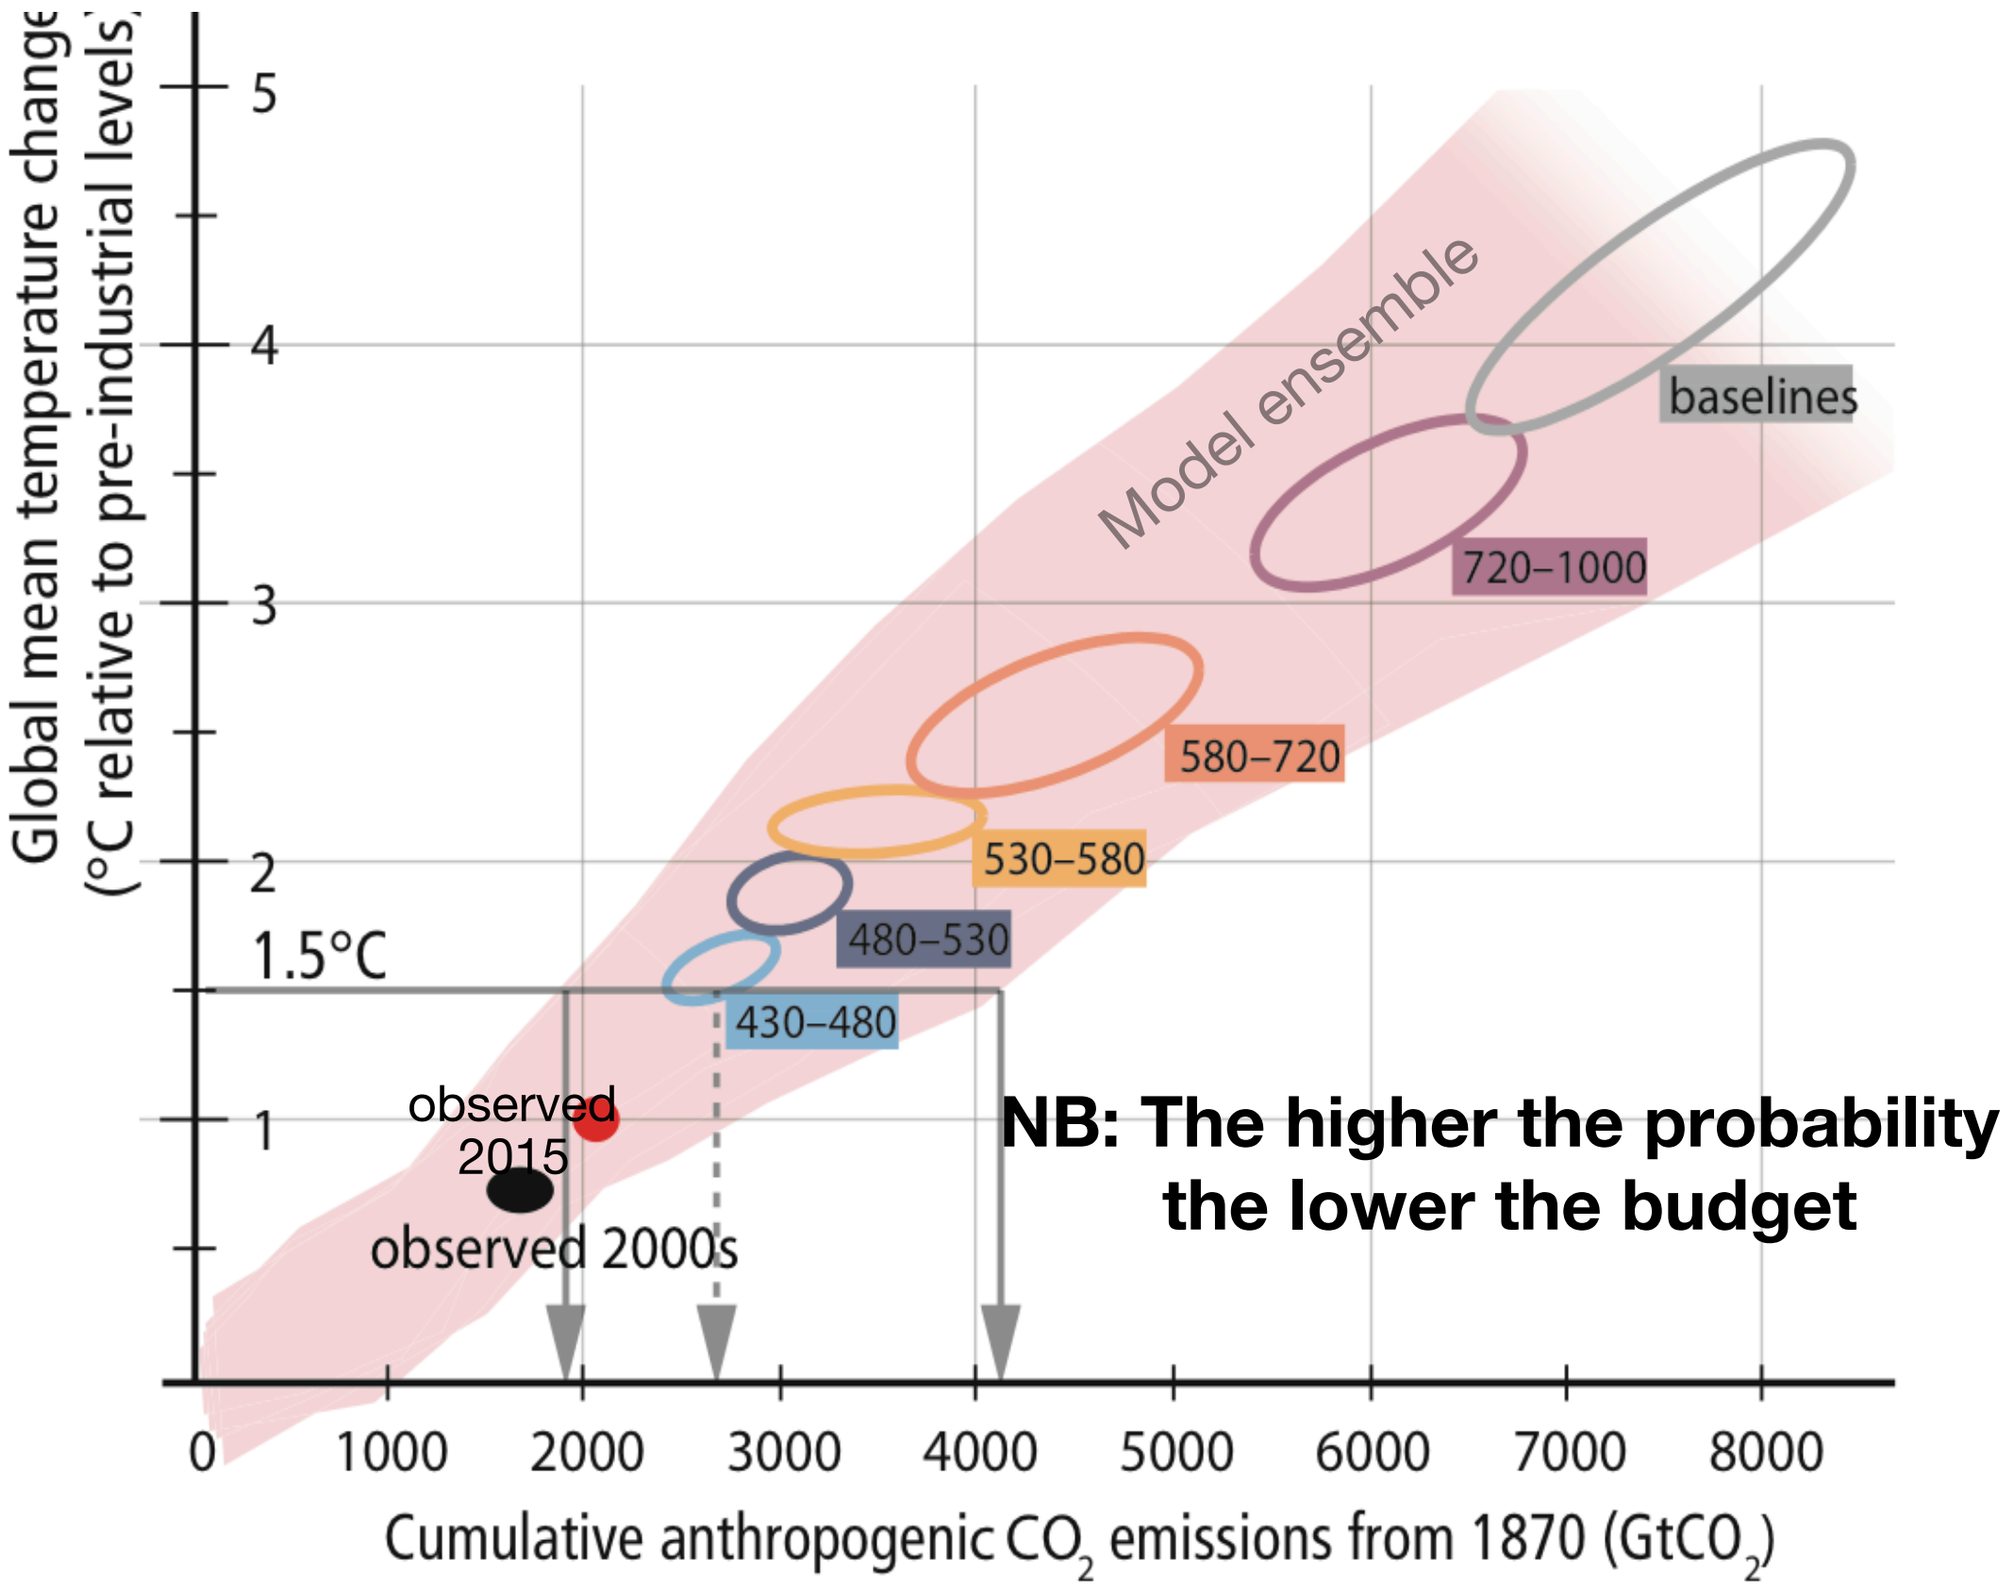
Losses

Risk to coastal areas

IPCC, AR5, SYR, SPM 8

ipcc
INTERGOVERNMENTAL PANEL ON climate change
WMO UNEP

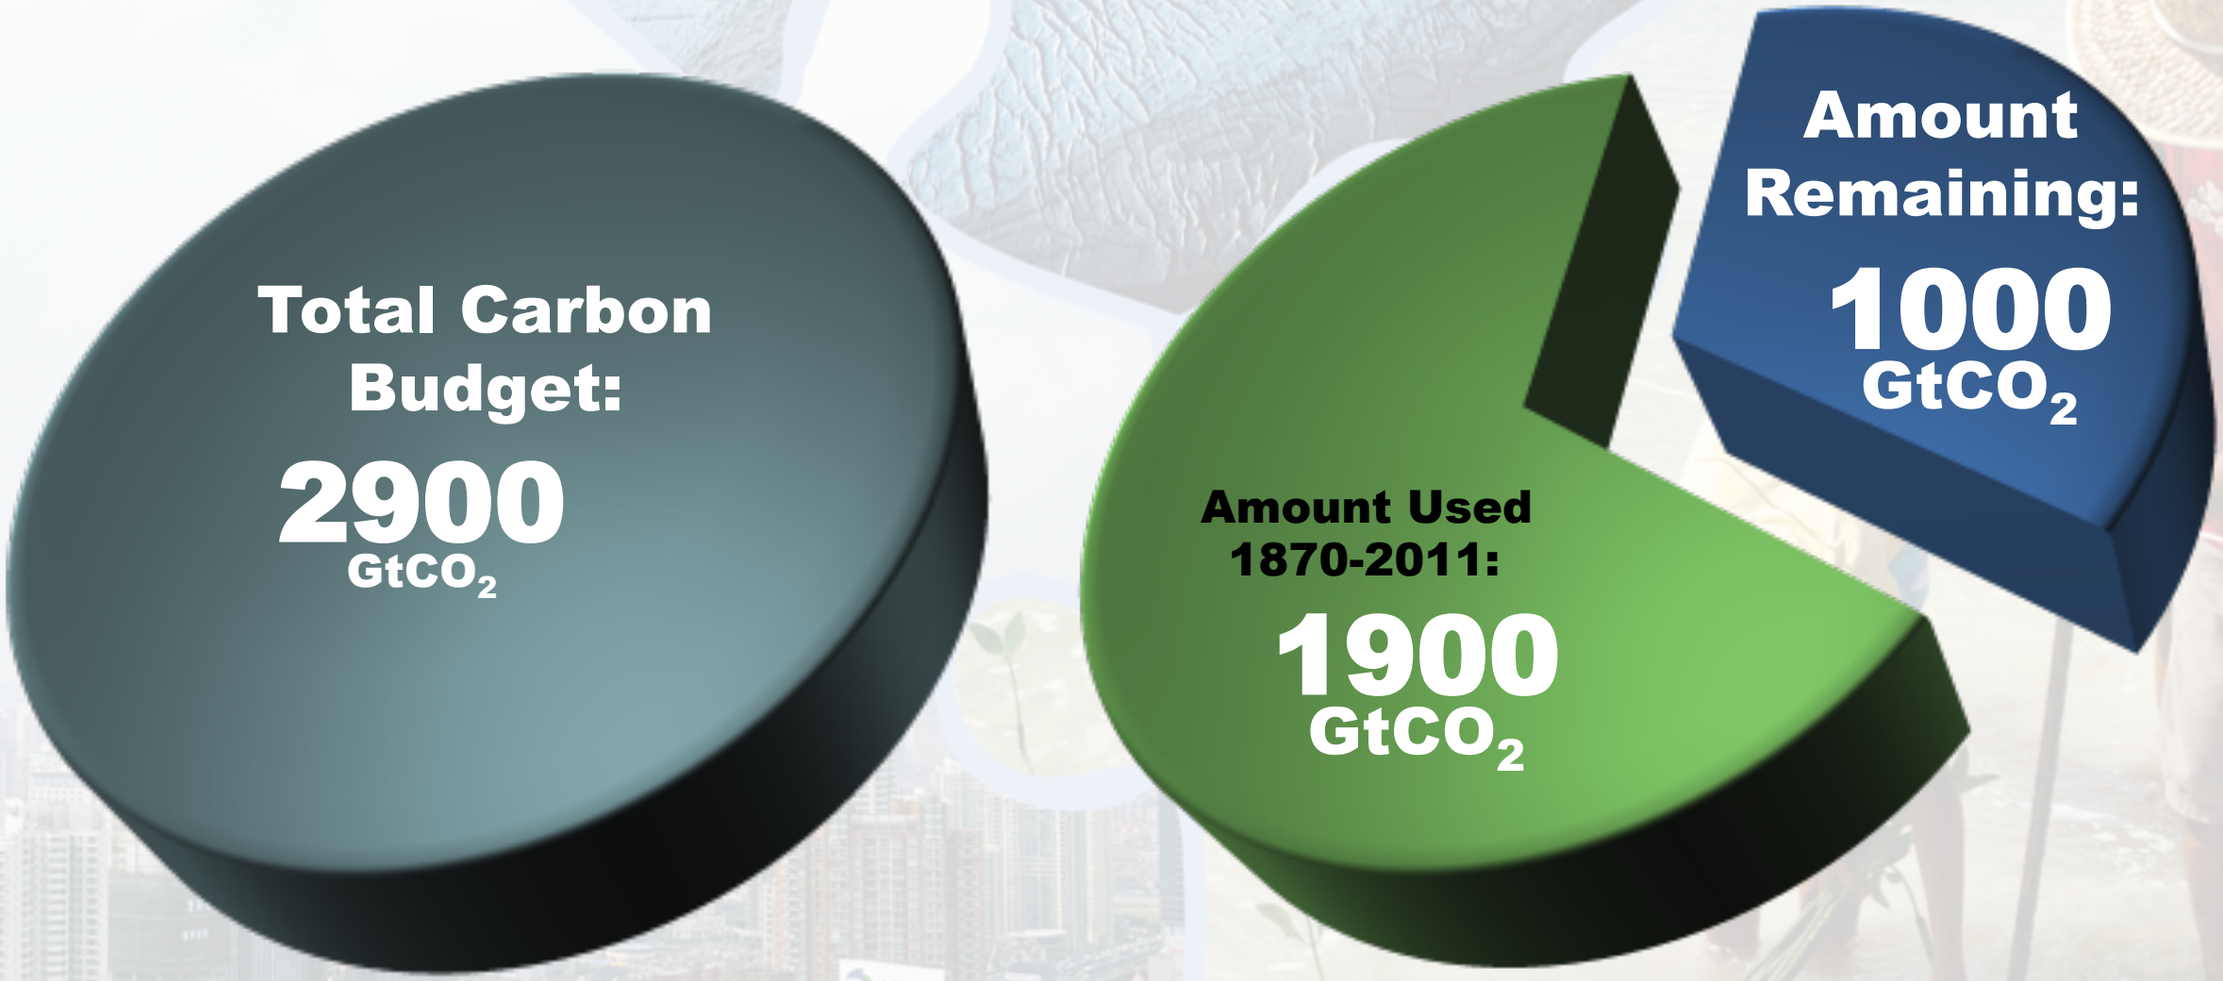
Cumulative emissions (budgets) approximately determine global warming



Based on IPCC AR5, Synthesis report (2014)

The window for action is rapidly closing

65% of the carbon budget compatible with a 2°C goal is already used
NB: this is with a probability greater than 66% to stay below 2°C



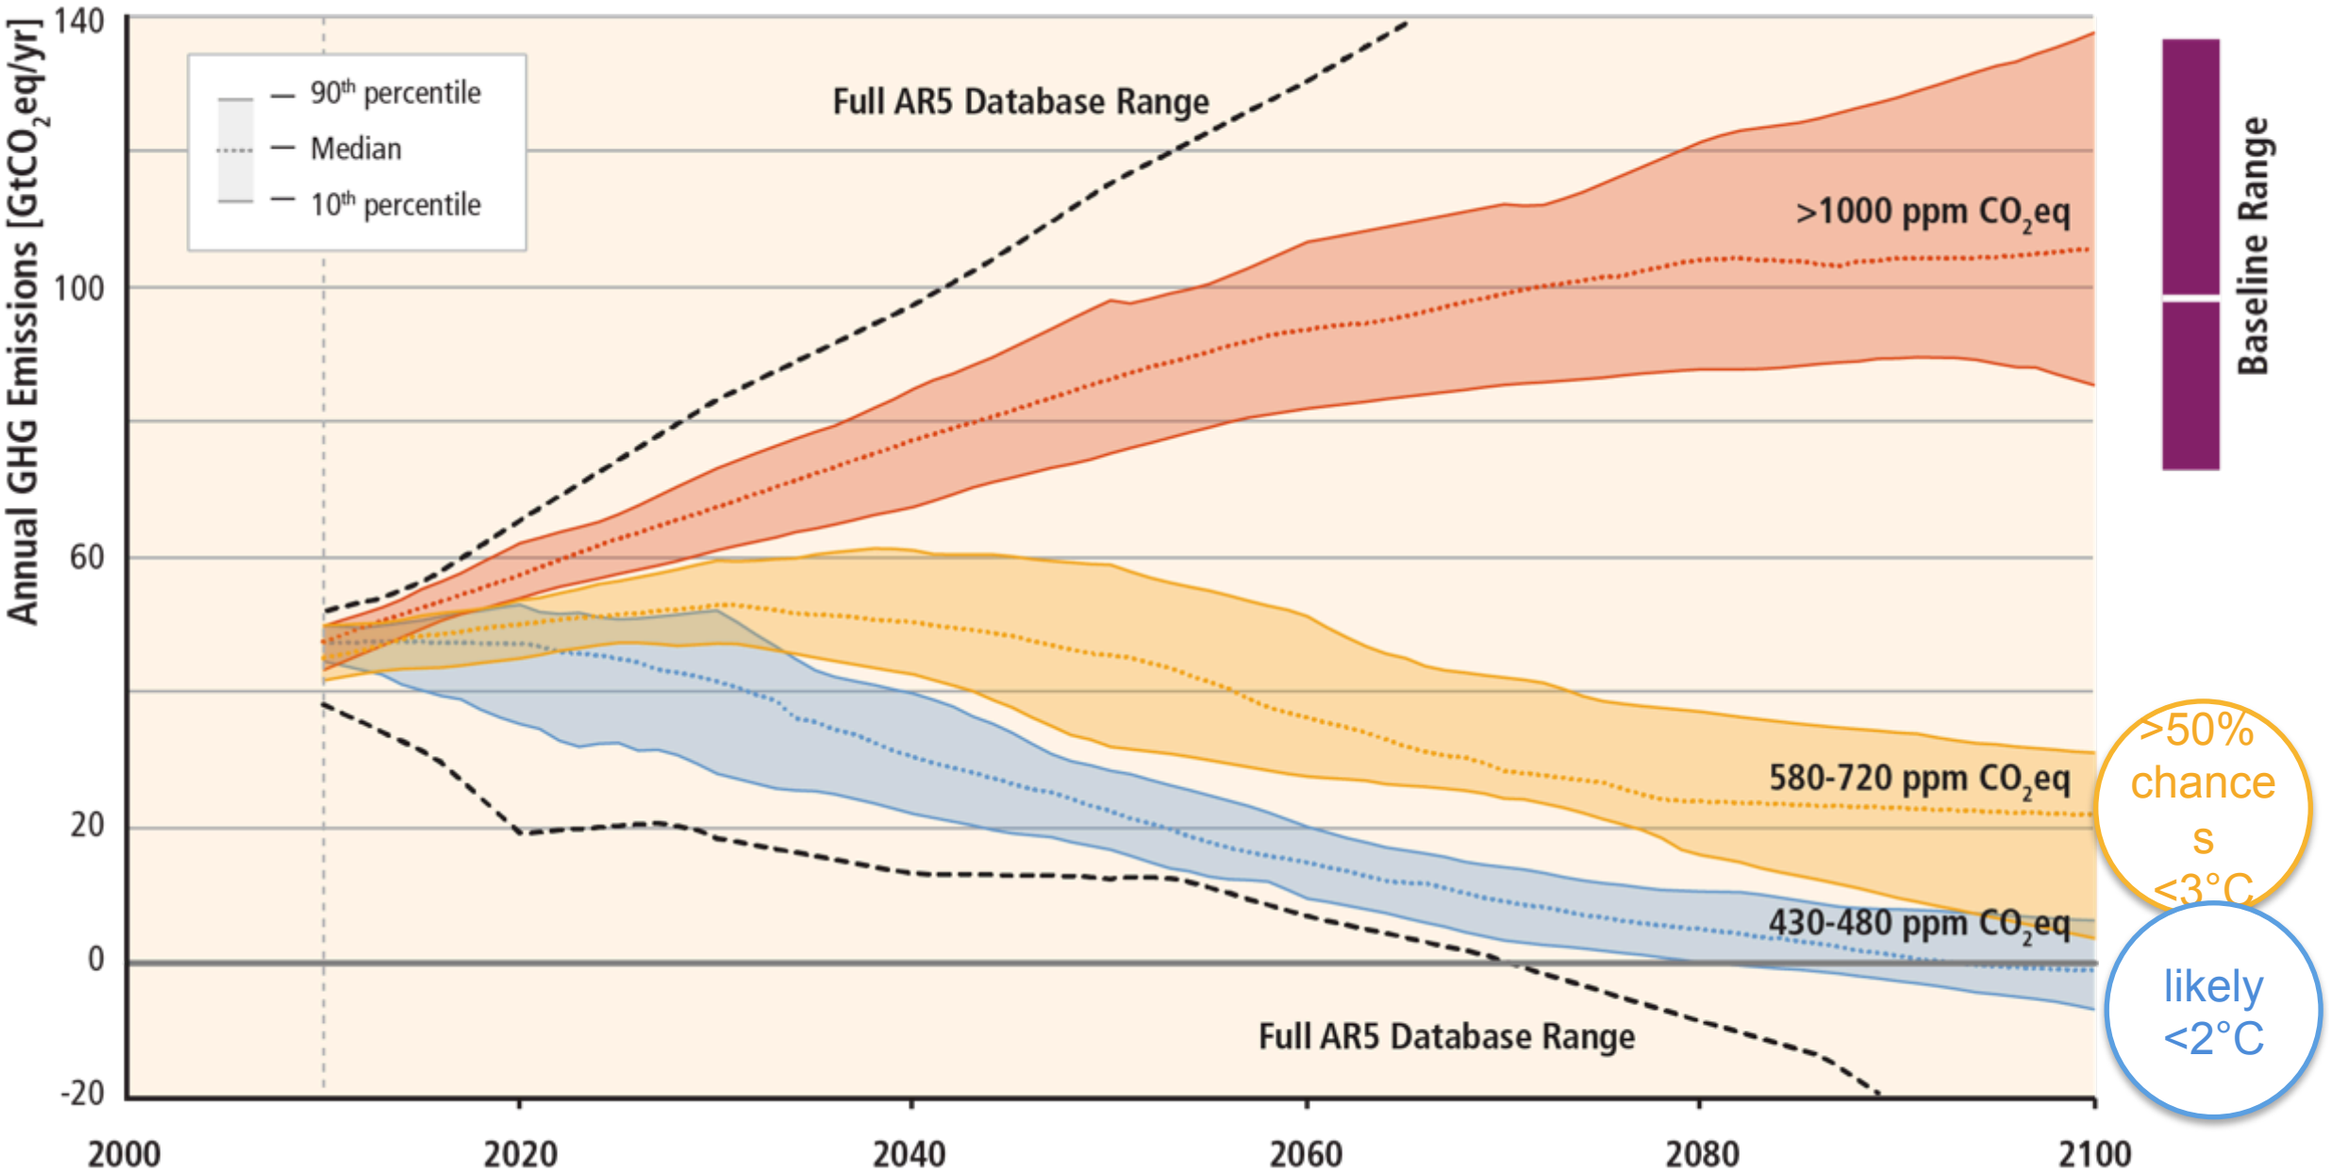
NB: Emissions in 2011: 38 GtCO2/yr

AR5 WGI SPM

IPCC AR5 Synthesis Report

INTERGOVERNMENTAL PANEL ON climate change

Stabilization of atmospheric concentrations requires moving away from the baseline – regardless of the mitigation goal



Based on AR5 WGIII Figure 6.7

WGIII Scenarios groups : key characteristics

CO_2eq Concentrations in 2100 (CO_2 eq) Category label (conc. range)	Subcategories	Change in CO_2eq emissions compared to 2010 (in %)		Temperature change in 2100 - median climate sensitivity	Likelihood of staying below specific temperature levels (relative to 1850-1900 = « pre-industrial »)
		2050	2100		
< 430	*Only a limited number of individual model studies have explored levels below 430 ppm CO_2eq*				
450 (430 – 480)	Total range[1]	-72 to -41	-118 to -78	1.5-1.7	Likely (66%) to stay below **2°C,** < *50%* chances to stay below **1.5°C**
500 (480 – 530)	No overshoot of 530 ppm CO_2eq	-52 to -42	-107 to -73	1.7-1.9	> 50% chances to stay below **2°C**
	Overshoot of 530 ppm CO_2eq	-55 to -25	-114 to -90	1.8-2.0	About 50% chances to stay below **2°C**
550 (530 – 580)	No overshoot of 580 ppm CO_2eq	-47 to -19	-81 to -59	2.0-2.2	Likely (66%) to stay below **3°C,** < 50% chances to stay below 2°C
	Overshoot of 580 ppm CO_2eq	-16 to 7	-183 to -86	2.1-2.3	
(580 – 650)	Total range	-38 to 24	-134 to -50	2.3-2.6	

Based IPCC AR5 WGIII table SPM.1 (incomplete : higher emissions scenarios not shown)

AR5 SYR: Carbon dioxide « budgets »

Cumulative CO_2 emissions from 1870 in $GtCO_2$						
Net anthropogenic warming [a]	<1.5°C			<2°C		
Fraction of simulations meeting goal [b]	66%	50%	33%	66%	50%	33%
Complex models, RCP scenarios only [c]	2250	2250	2550	2900	3000	3300
Simple model, WGIII scenarios [d]	No data	2300 to 2350	2400 to 2950	2550 to 3150	2900 to 3200	2950 to 3800
Cumulative CO_2 emissions from 2011 in $GtCO_2$						
Complex models, RCP scenarios only [c]	400	550	850	1000	1300	1500
Simple model, WGIII scenarios [d]	No data	550 to 600	600 to 1150	750 to 1400	1150 to 1400	1150 to 2050

<3°C (see AR5 SYR)

possible?
implications?

ranges likely to change
at least due to more studies

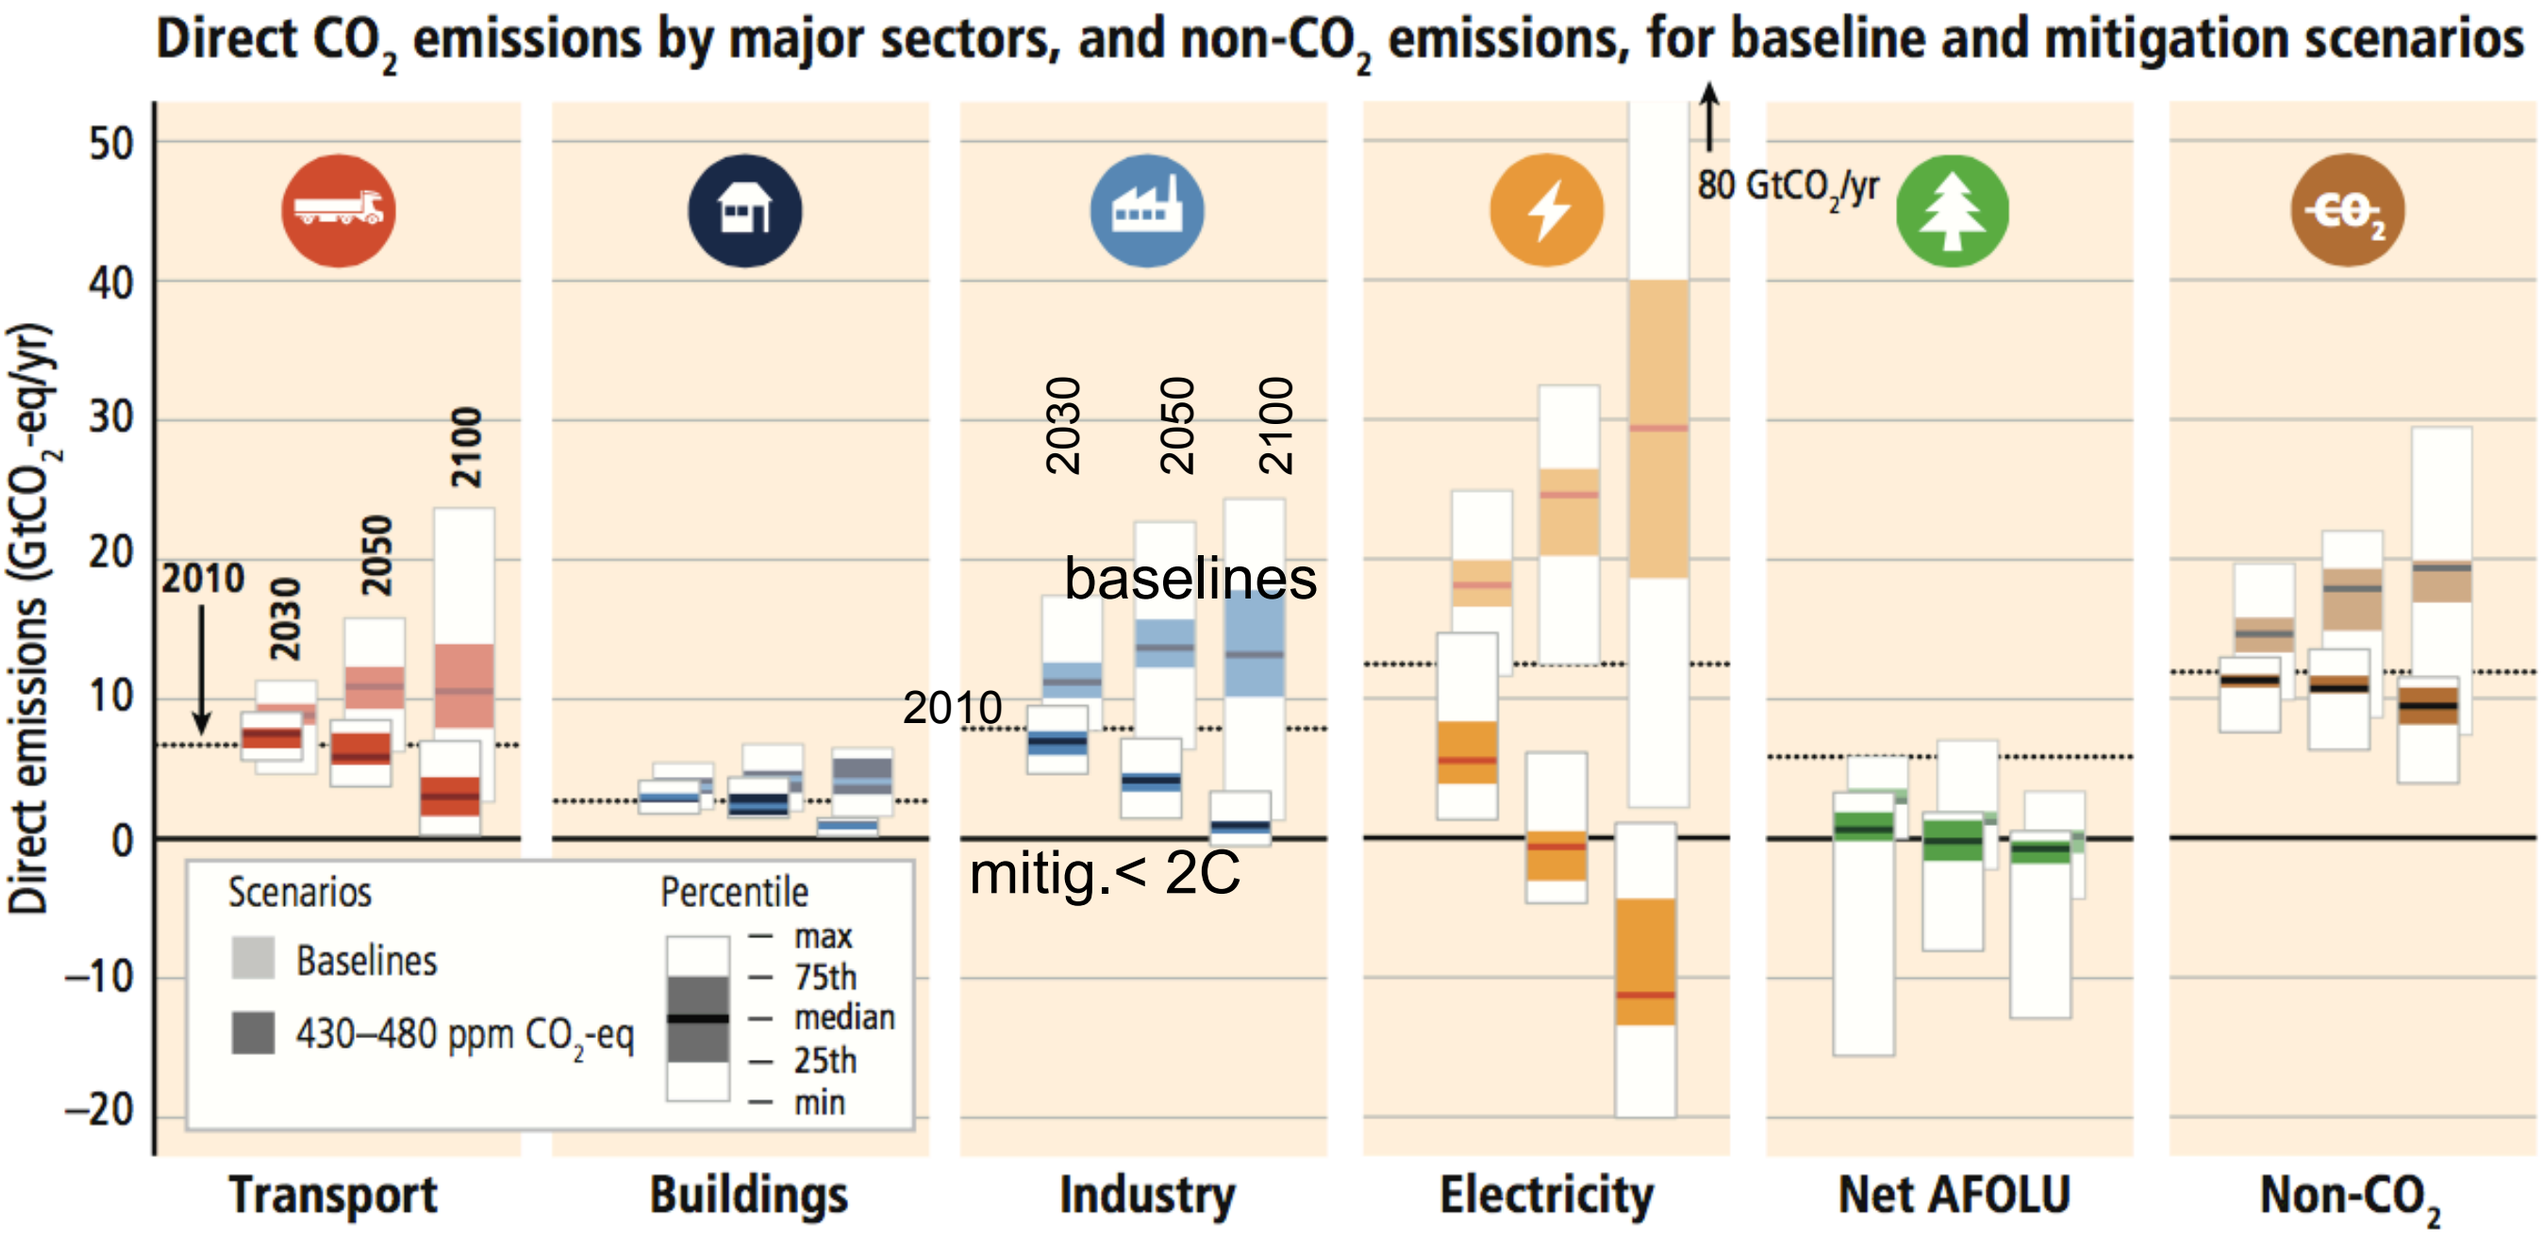
Emissions in sectors: baselines and « likely < 2°C »



AR5 SYR figure SPM.14

Paris agreement

- Article 2:
  - (…) to strengthen the global response to the threat of climate change, in the context of sustainable development and efforts to eradicate poverty, including by:
    - Holding the increase in the global average temperature to well below 2 °C above pre-industrial levels and to pursue efforts to limit the temperature increase to 1.5 °C above pre-industrial levels, recognizing that this would significantly reduce the risks and impacts of climate change;
    - Increasing the ability to adapt (…) and foster climate resilience and low greenhouse gas emissions development, in a manner that does not threaten food production;
    - Making finance flows consistent with a pathway towards low greenhouse gas emissions and climate-resilient development

IPCC Special Report on Global warming of 1.5°C

A IPCC special report on the impacts of global warming of 1.5°C above pre-industrial levels and related global greenhouse gas emission pathways, ***in the context of strengthening the global response to the threat of climate change, sustainable development, and efforts to eradicate poverty***

Proposed outline (as adopted in October 2016; report to be finalized in 2018) :

- Summary for policy makers (max 10 pages)
- Chapters :
  - 1. Framing and context
  - 2. Mitigation pathways compatible with 1.5°C in the context of sustainable development
  - 3. Impacts of 1.5°C global warming on natural and human systems
  - 4. Strengthening and implementing the global response to the threat of climate change
  - 5. Sustainable development, poverty eradication and reducing inequalities
- Boxes (integrated case studies/regional and cross-cutting themes),
- FAQs (10 pages)

Global warming of 1.5°C

A IPCC special report on the impacts of global warming of 1.5°C above pre-industrial levels and related global greenhouse gas emission pathways, ***in the context of strengthening the global response to the threat of climate change, sustainable development, and efforts to eradicate poverty***

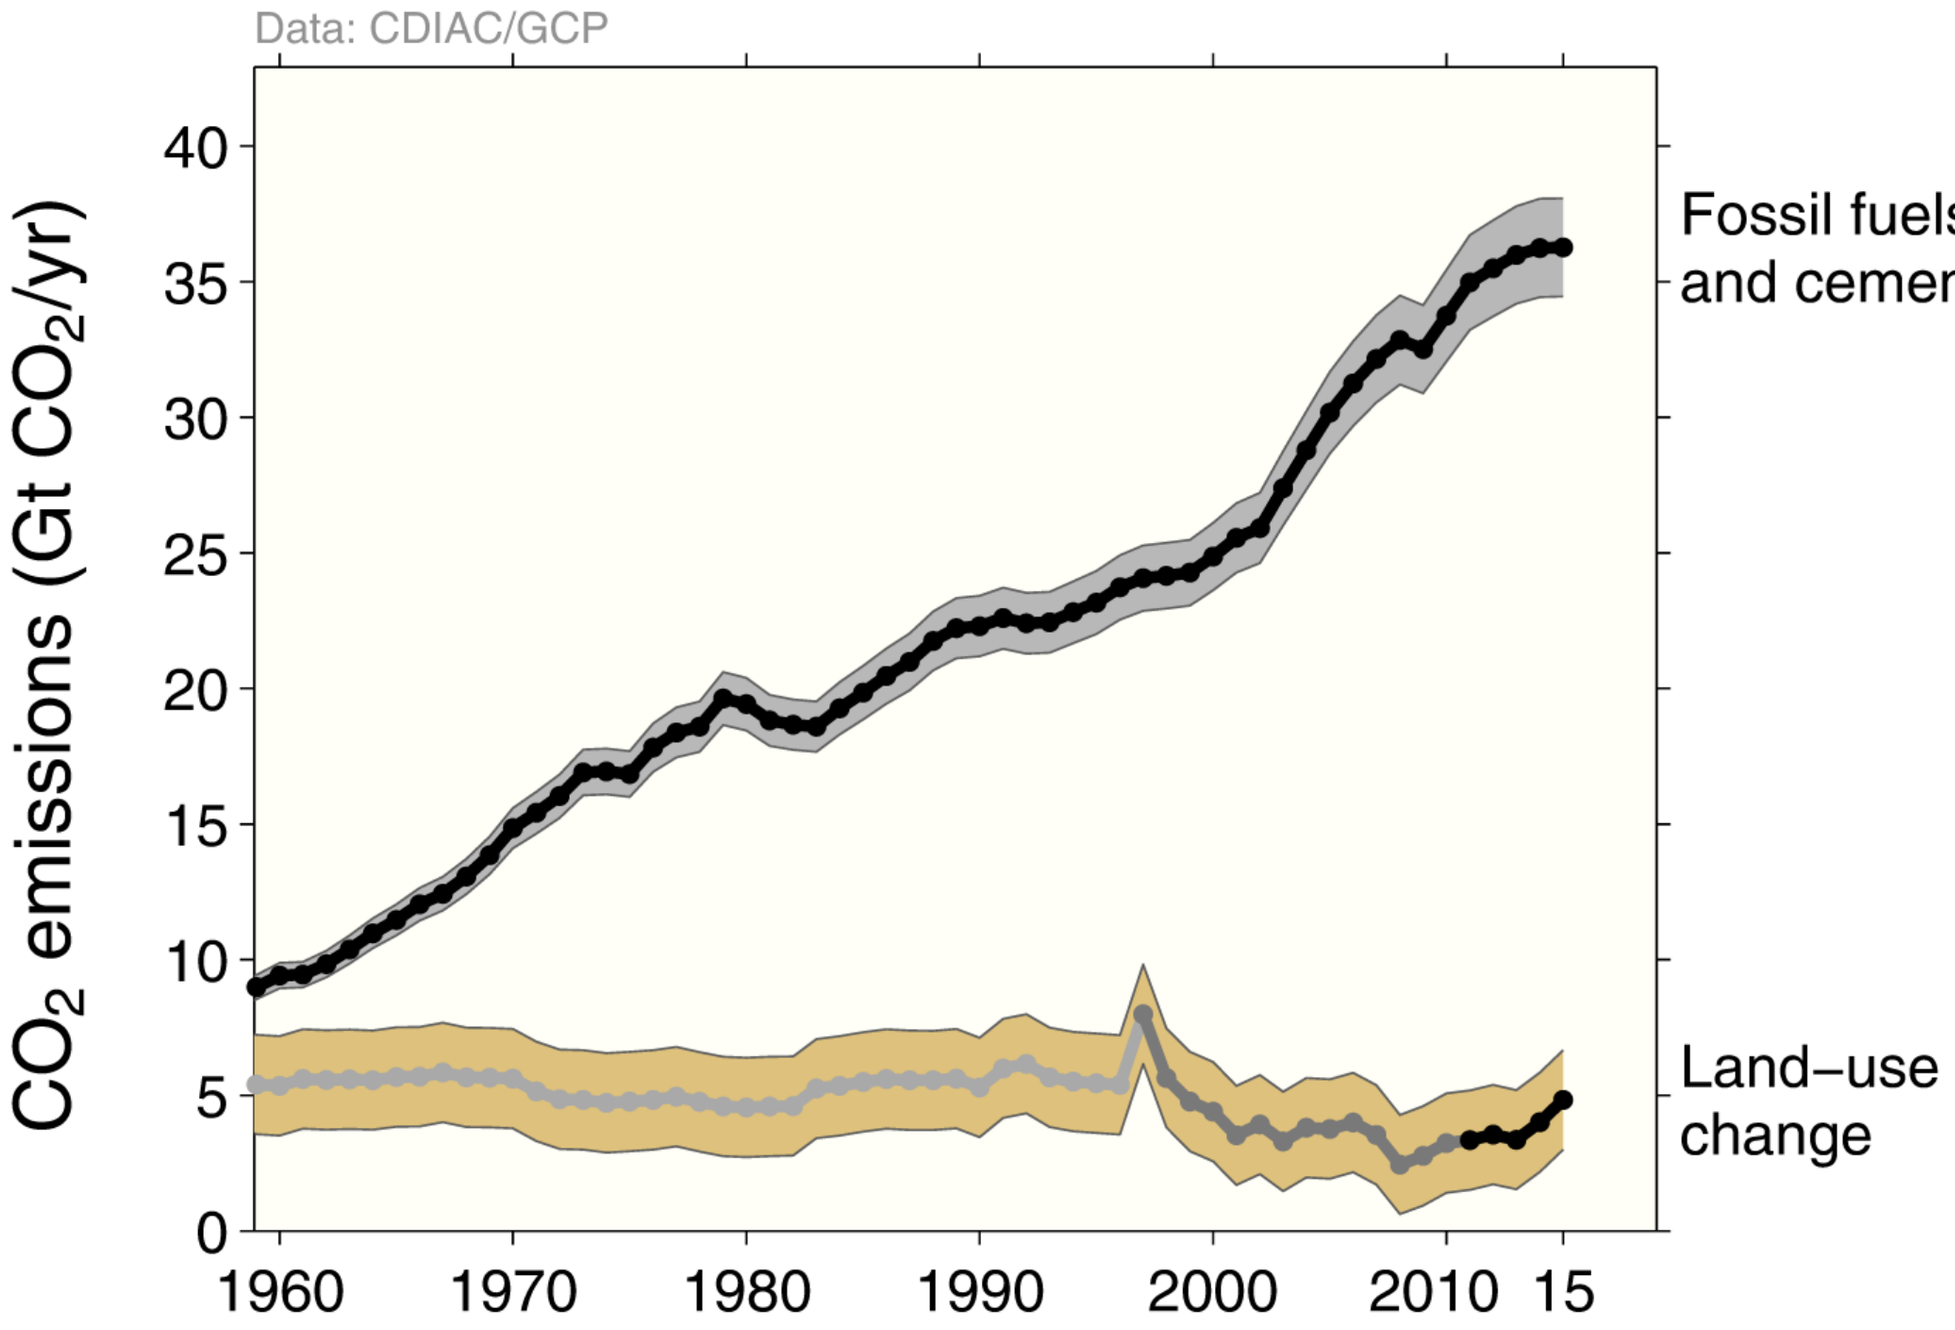
Total global emissions

Total global emissions: 41.9 ± 2.8 $GtCO_2$ in 2015, 49% over 1990
Percentage land-use change: 36% in 1960, 9% averaged 2006-2015



Source: CDIAC; Houghton et al 2012; Giglio et al 2013; Le Quéré et al 2016; Global Carbon Budget 2016

Tentative and personal conclusions
(writing of the SR1.5 is not over yet!)

1.5°C matters: lower impacts, adaptation less costly than in 2°C world, even if there is a temporary overshoot above 1.5°C

It is very ambitious to reduce emissions enough for a 1.5°C long-term average temperature above pre-industrial objective; a little easier with overshoot

The slower radical changes in emission patterns take place, the more we may need uncertain or risky technologies, such as large use of carbon dioxide removal from the atmosphere (possibly at the expense of bio-energy competition with food production) or geoengineering in the form of solar radiation management

Decision making needs the best scientific information possible – the IPCC SR 1.5 will be essential to raise ambition within the Talanoa Dialogue, but much can be done without waiting for it
