# Perspectief

**Saturn, as seen on 25-4-2016 from a 3 million km distance by the Cassini satellite launched in October 1997, 40 years after Sputnik**

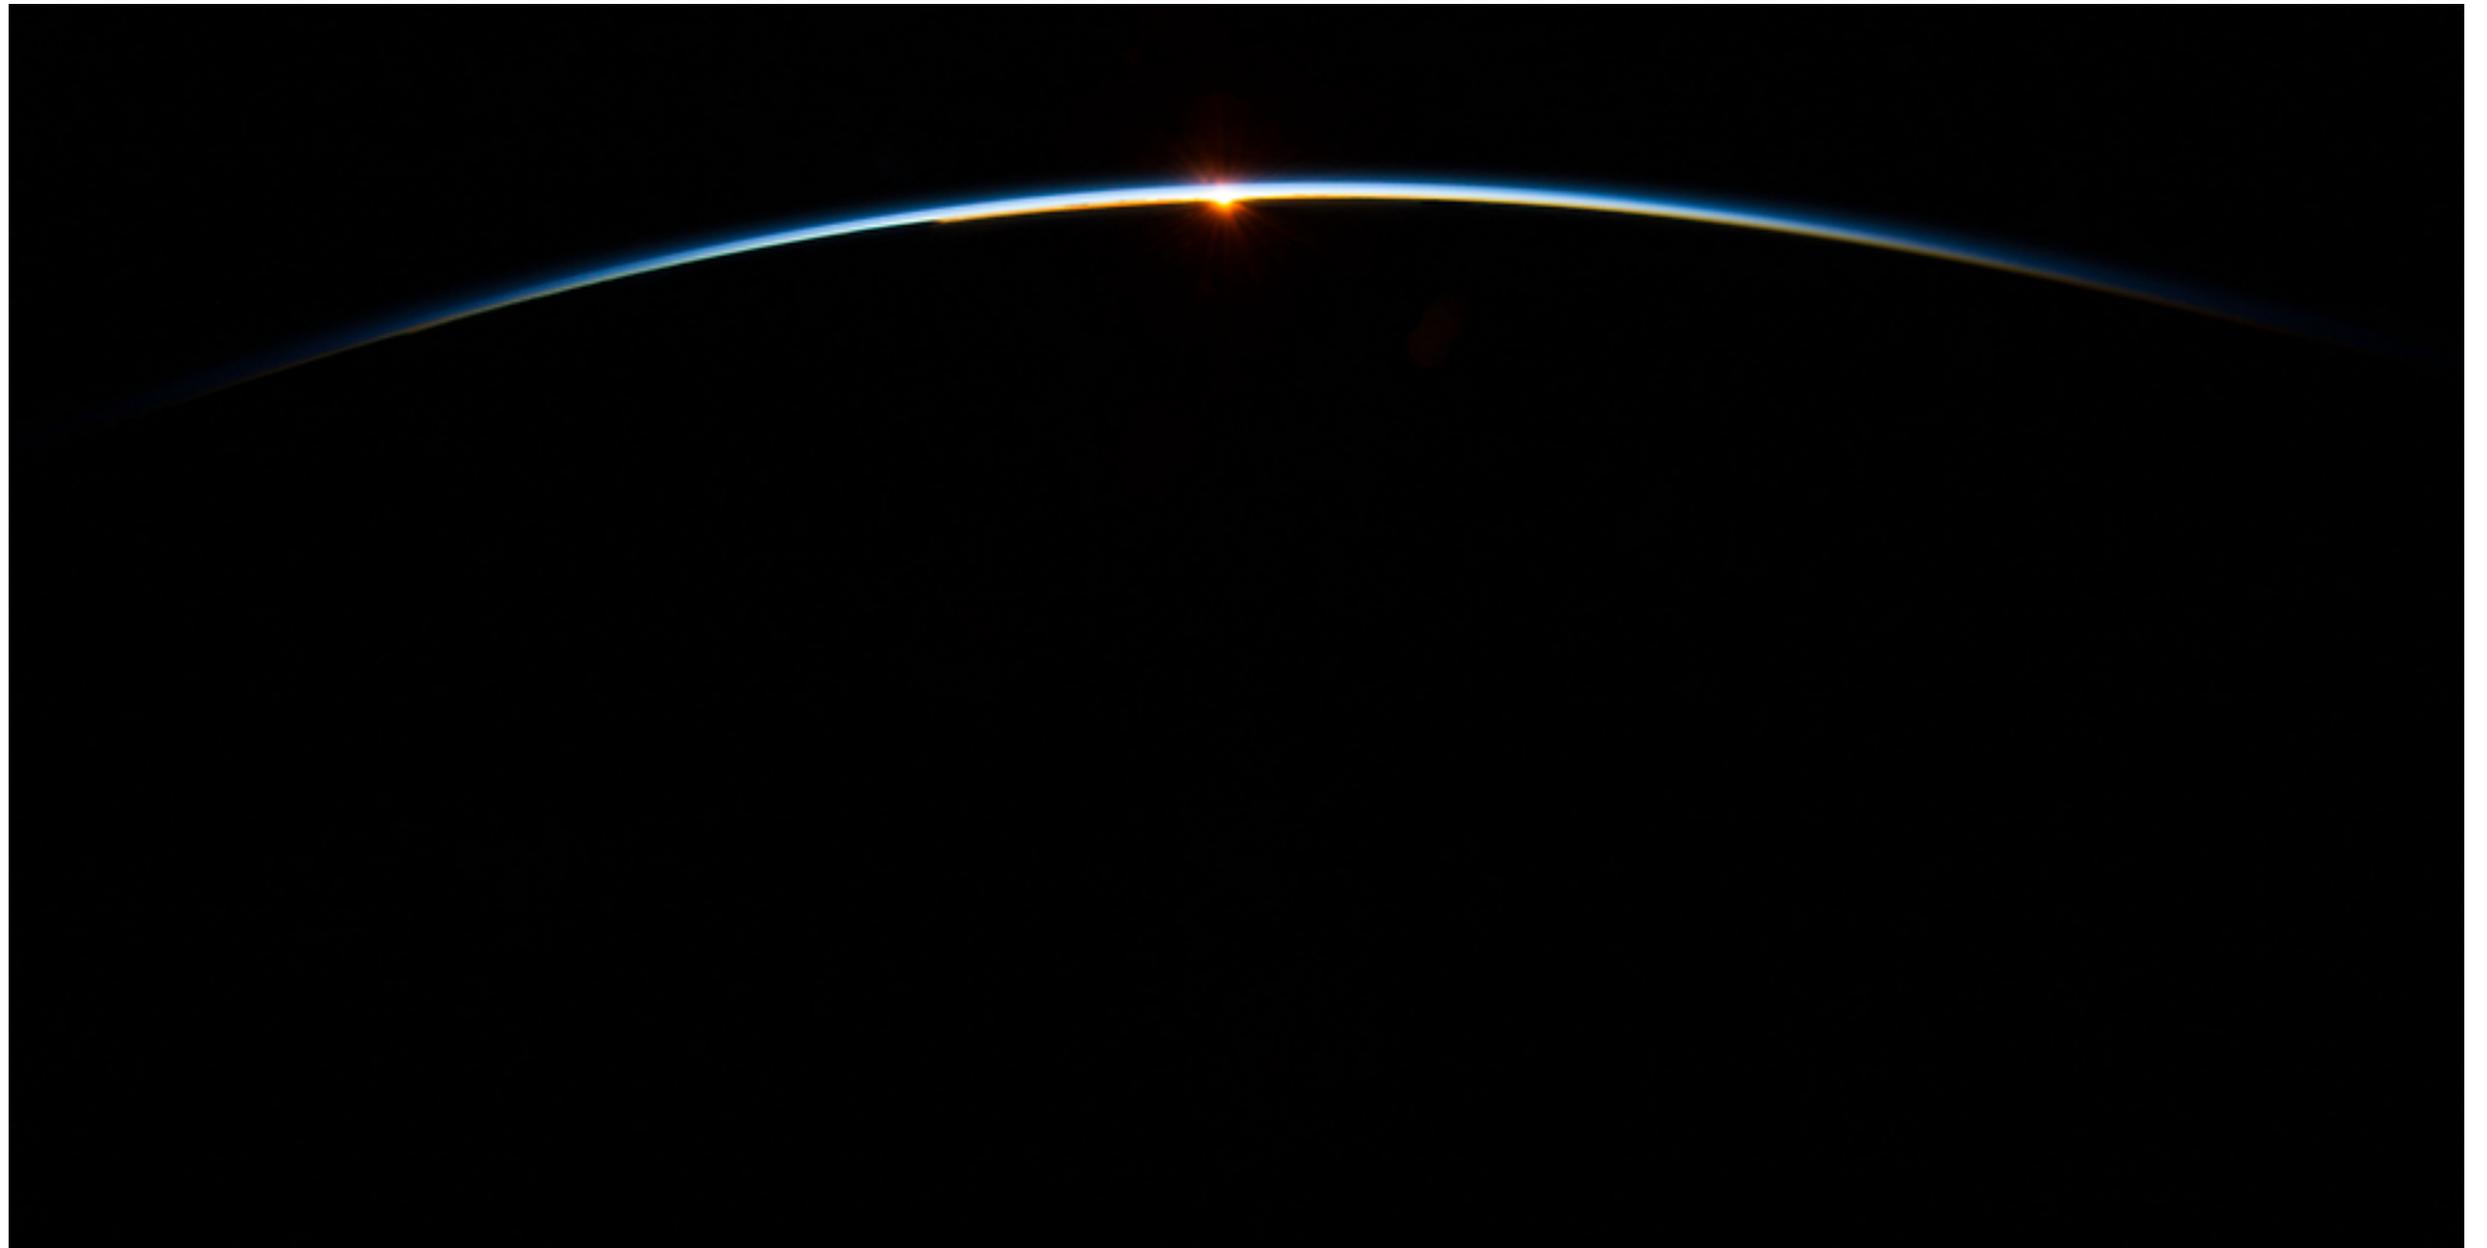

@JPvan Ypersele

**That small blue dot is the Earth, as seen from Cassini, orbiting Saturn, 1.44 billion km from us, on 19-7-2013**

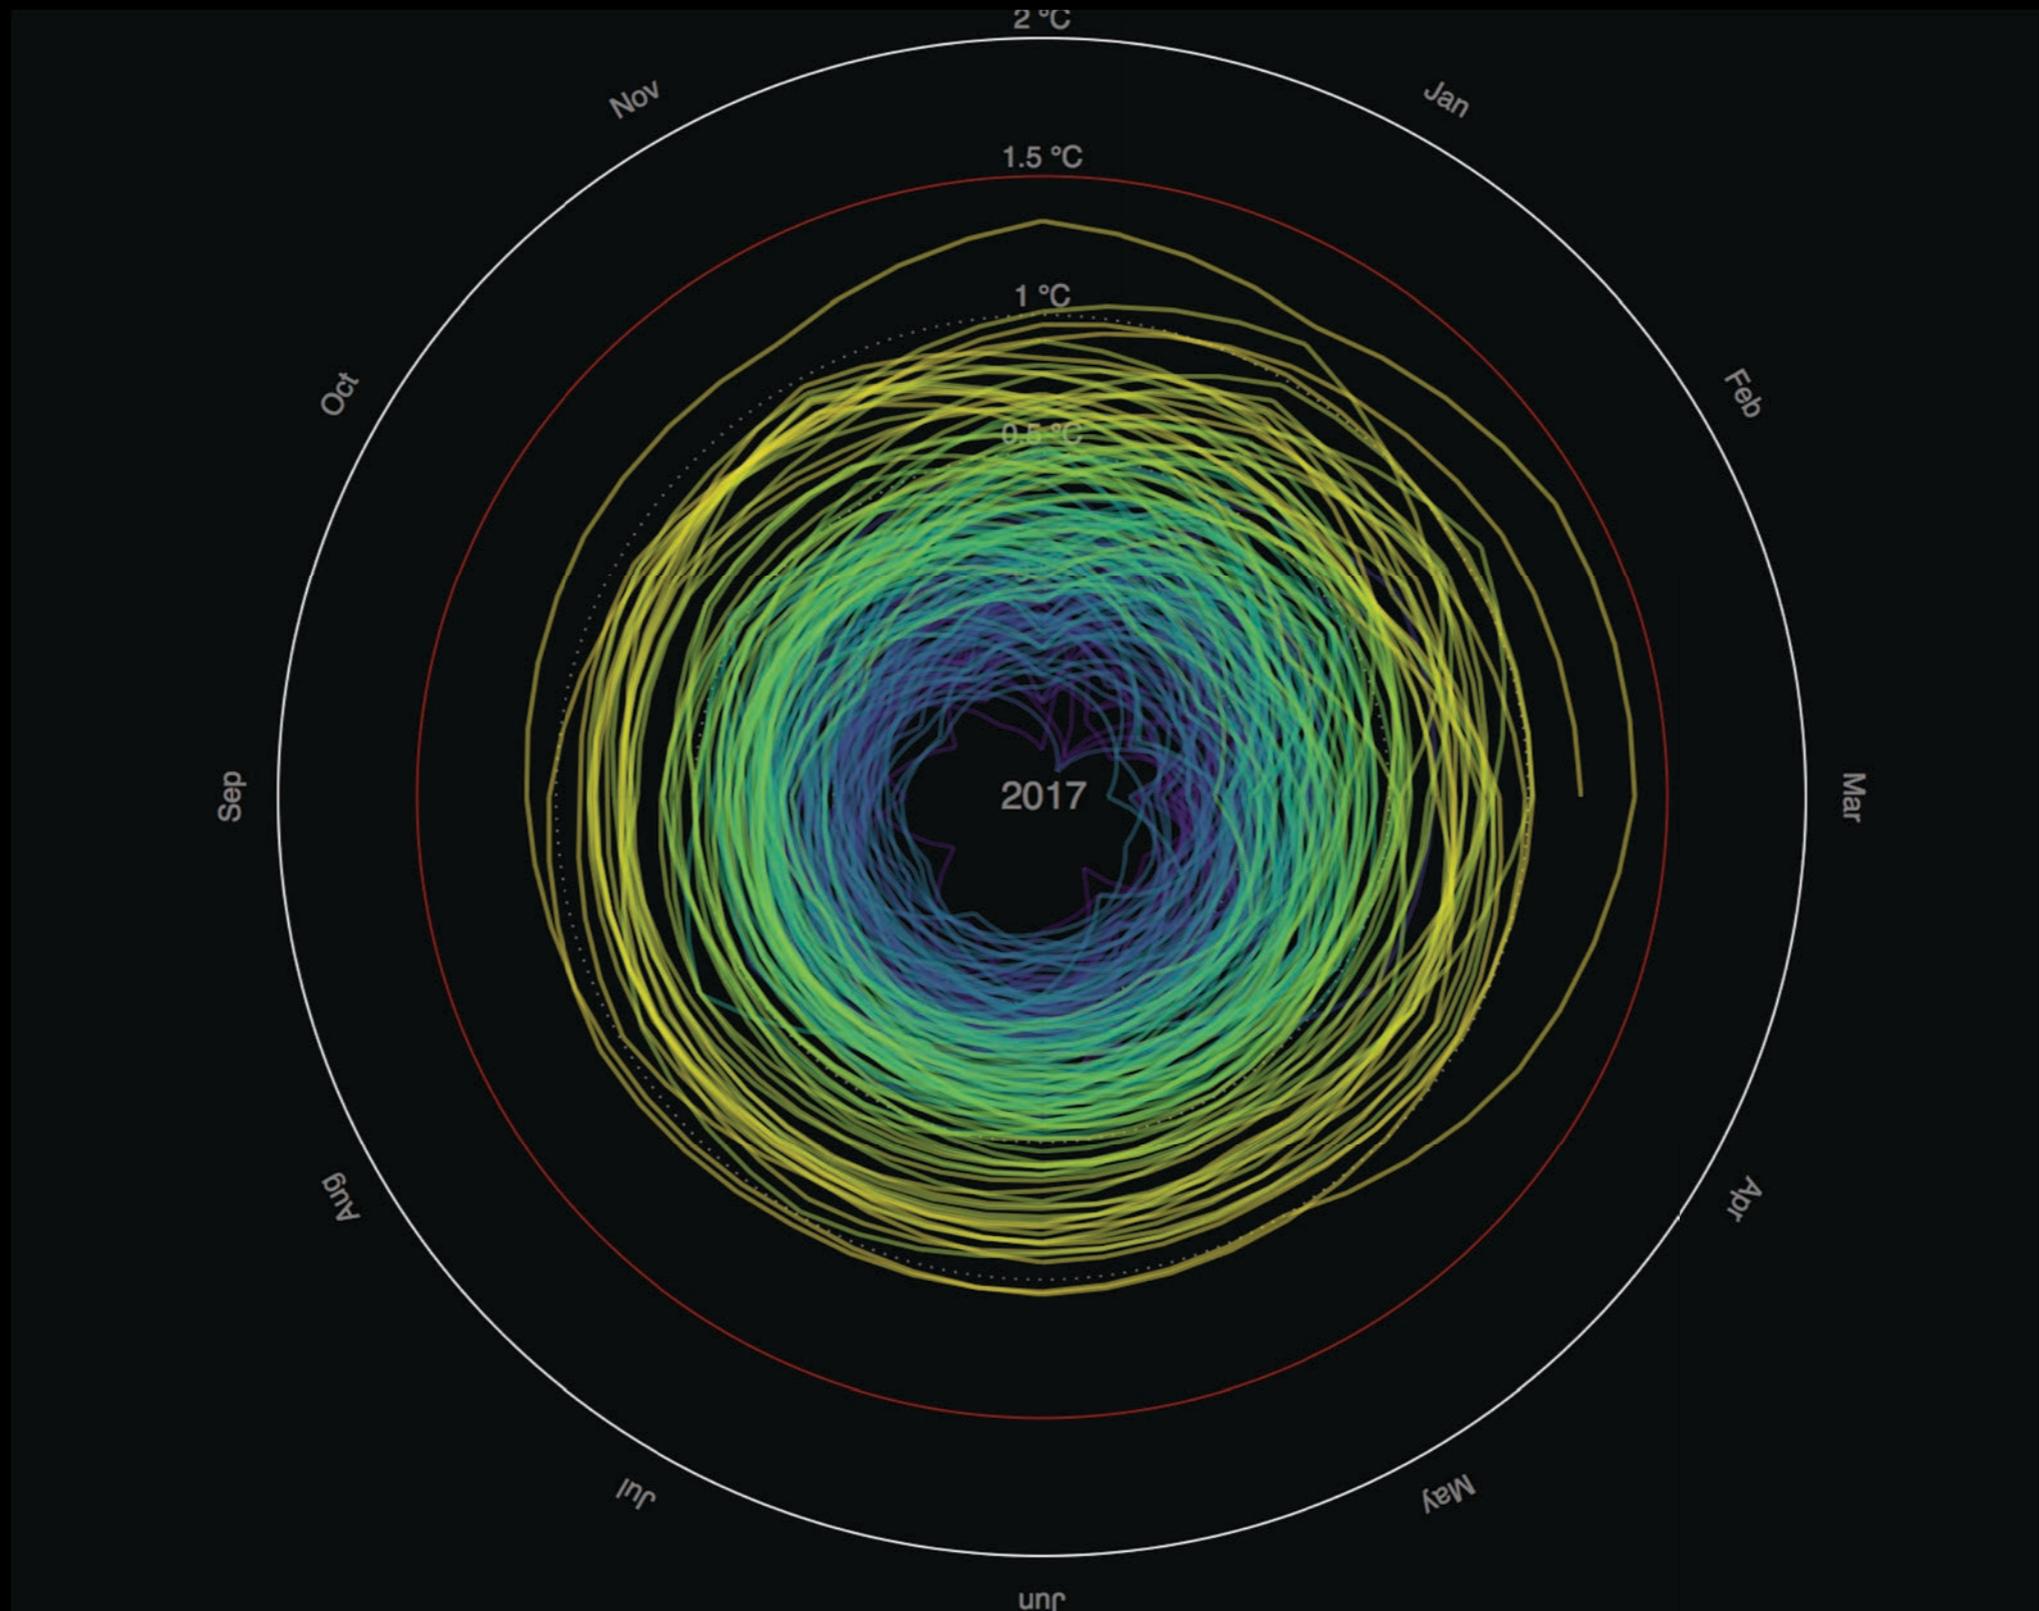

@JPvanYpersele

# **Our atmosphere is thin and fragile (as seen by ISS crew on 31 July 2013)**

@JPvan Ypersele

# Temperature spiral

Global Mean Temperature in °C relative to 1850 – 1900

Graph: Ed Hawkins (Climate Lab Book) – Data: HadCRUT4 global temperature dataset

Animated version available on <http://openclimatedata.net/climate-spirals/temperature>

Since 1950, **extreme hot days** and **heavy precipitation** have become more common

There is evidence that anthropogenic influences, including increasing atmospheric **greenhouse gas concentrations**, have changed these extremes

# A Progression of Understanding: Greater and Greater Certainty in Attribution

AR1 (1990):  
“unequivocal detection  
not likely for a decade”

AR2 (1995): “balance  
of evidence suggests  
**discernible** human  
influence”

AR3 (2001): “most of  
the warming since 1950  
is **likely**  
(odds 2 out of 3) due  
to human activities”

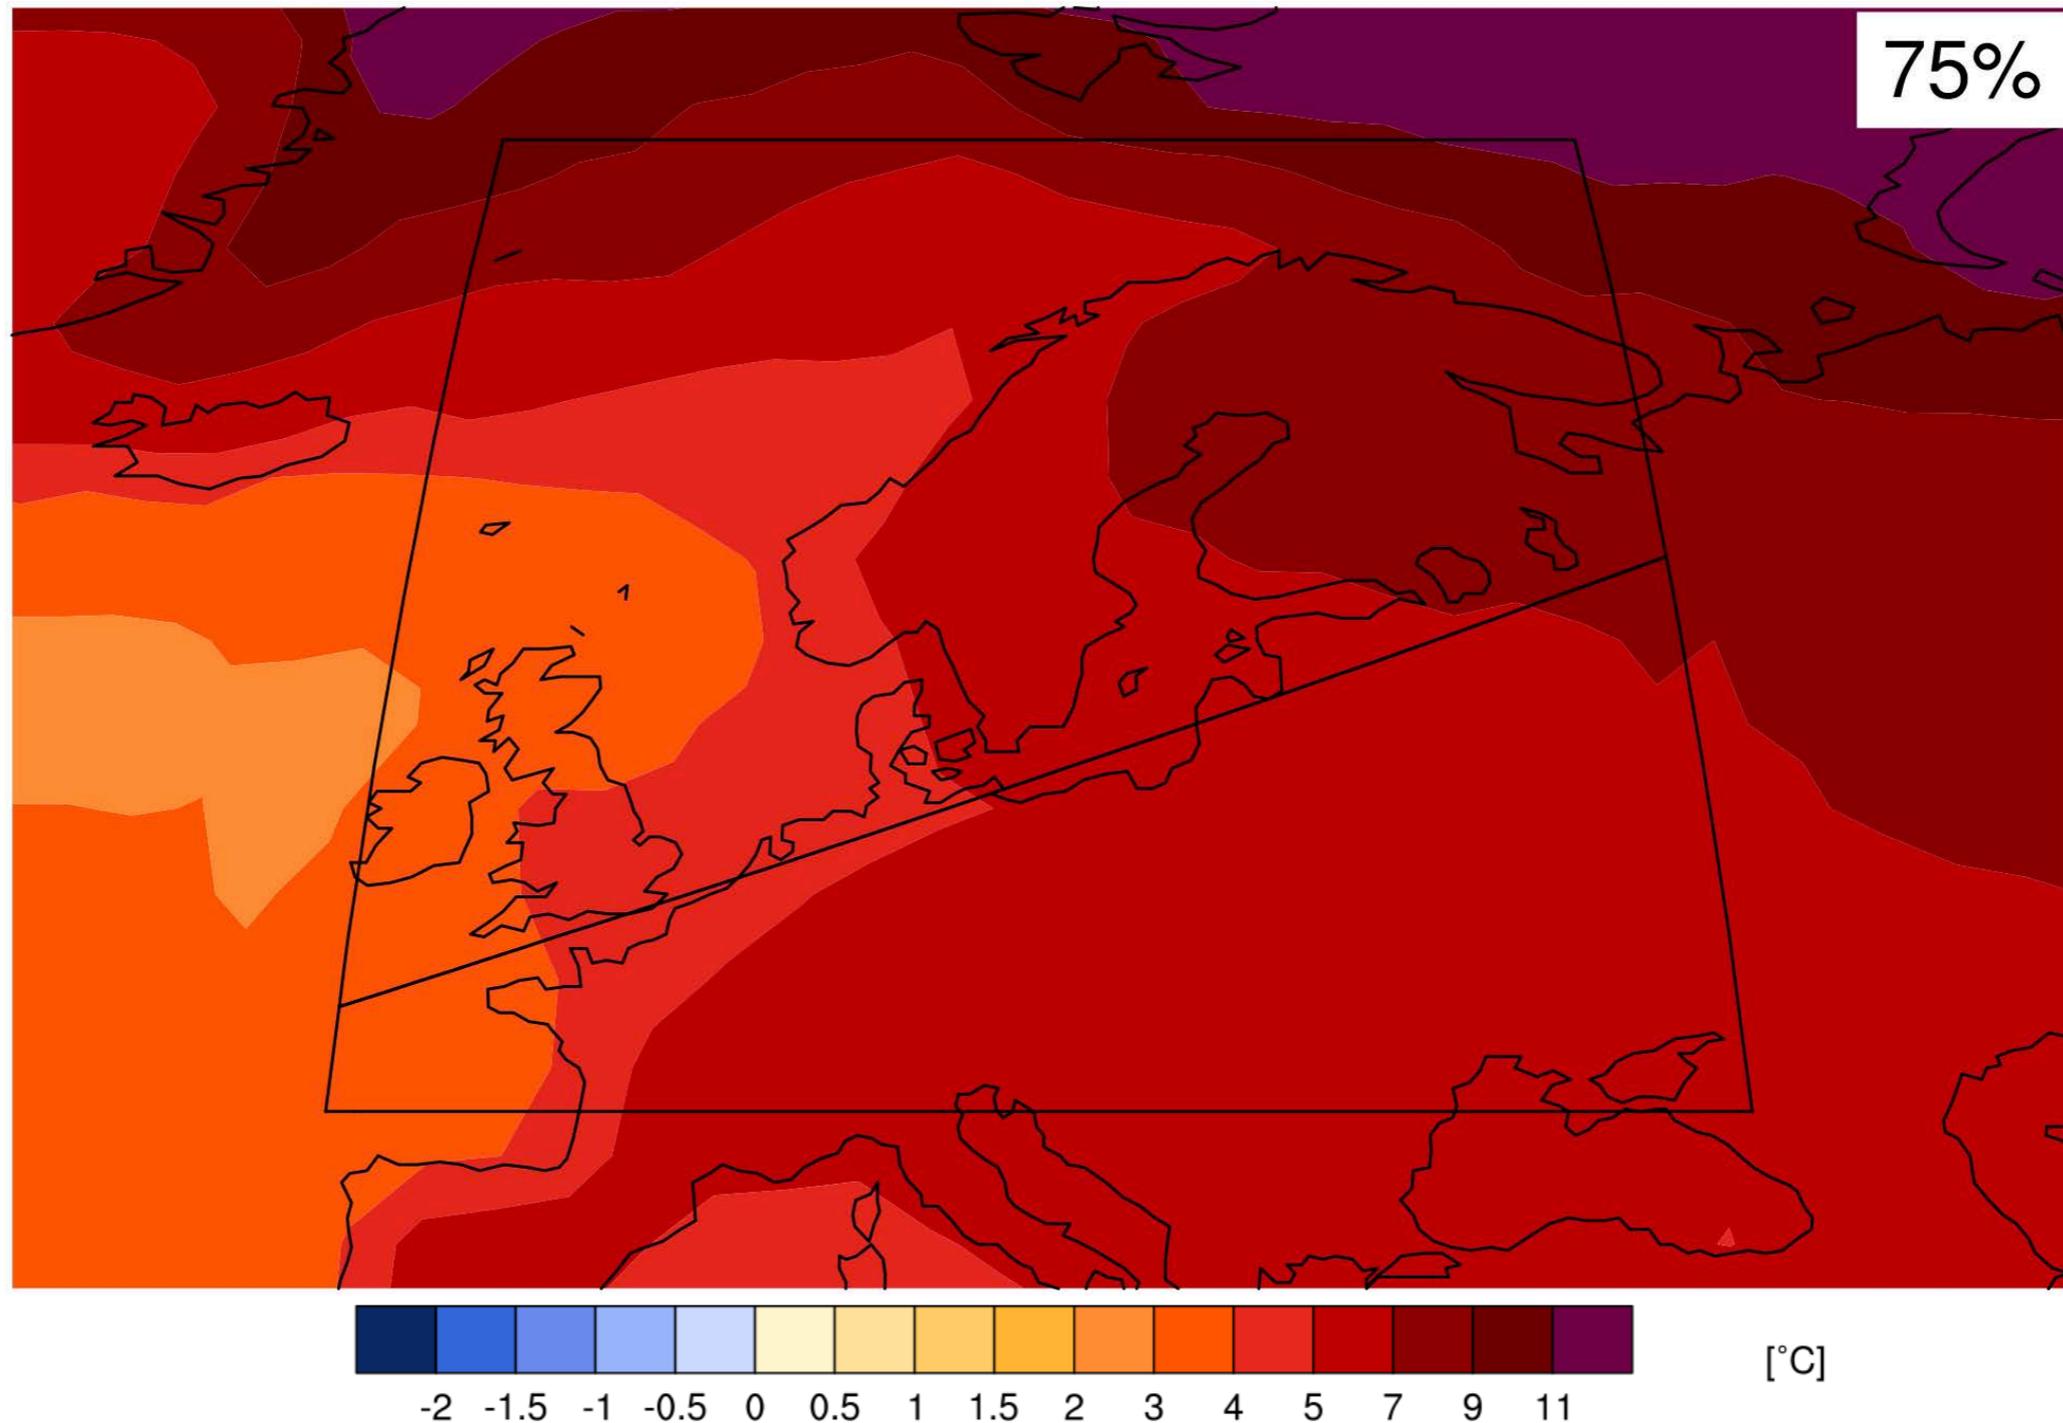

AR4 (2007): “most of  
the warming is **very  
likely** (odds 9 out of 10)  
due to greenhouse  
gases”

**Because we use the atmosphere  
as a dustbin for our greenhouse  
gases, we thicken the insulation  
layer around the planet**

**That is why we must cut emissions  
to (net) ZERO as soon as possible**

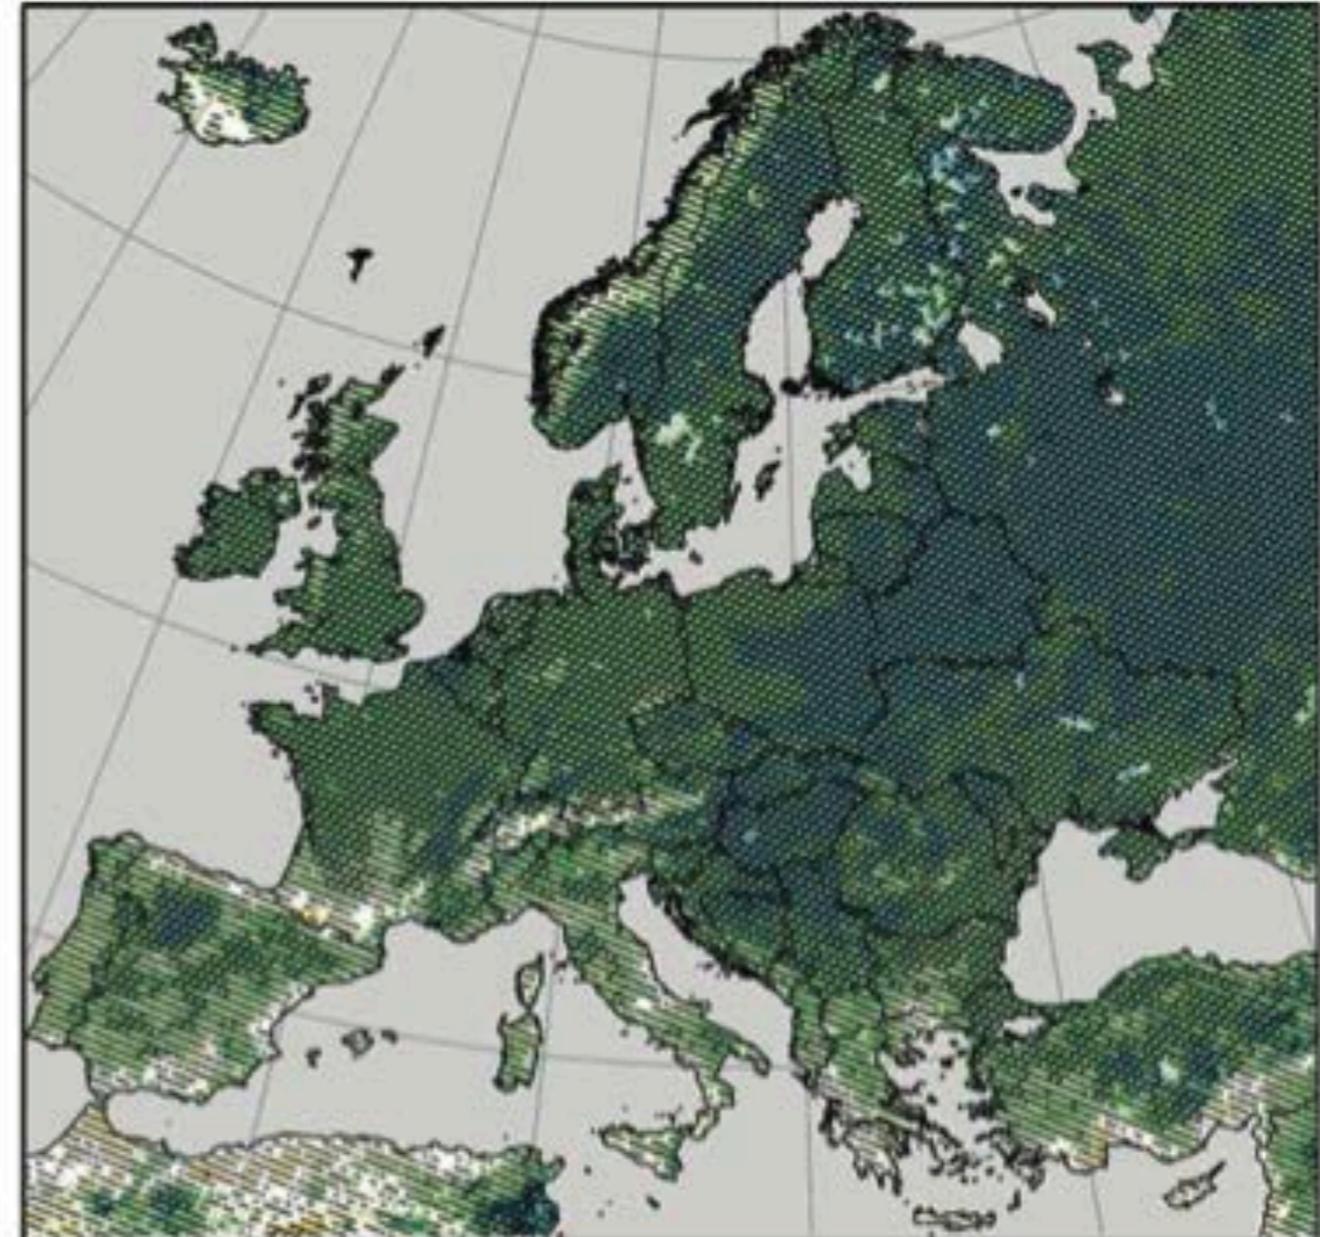

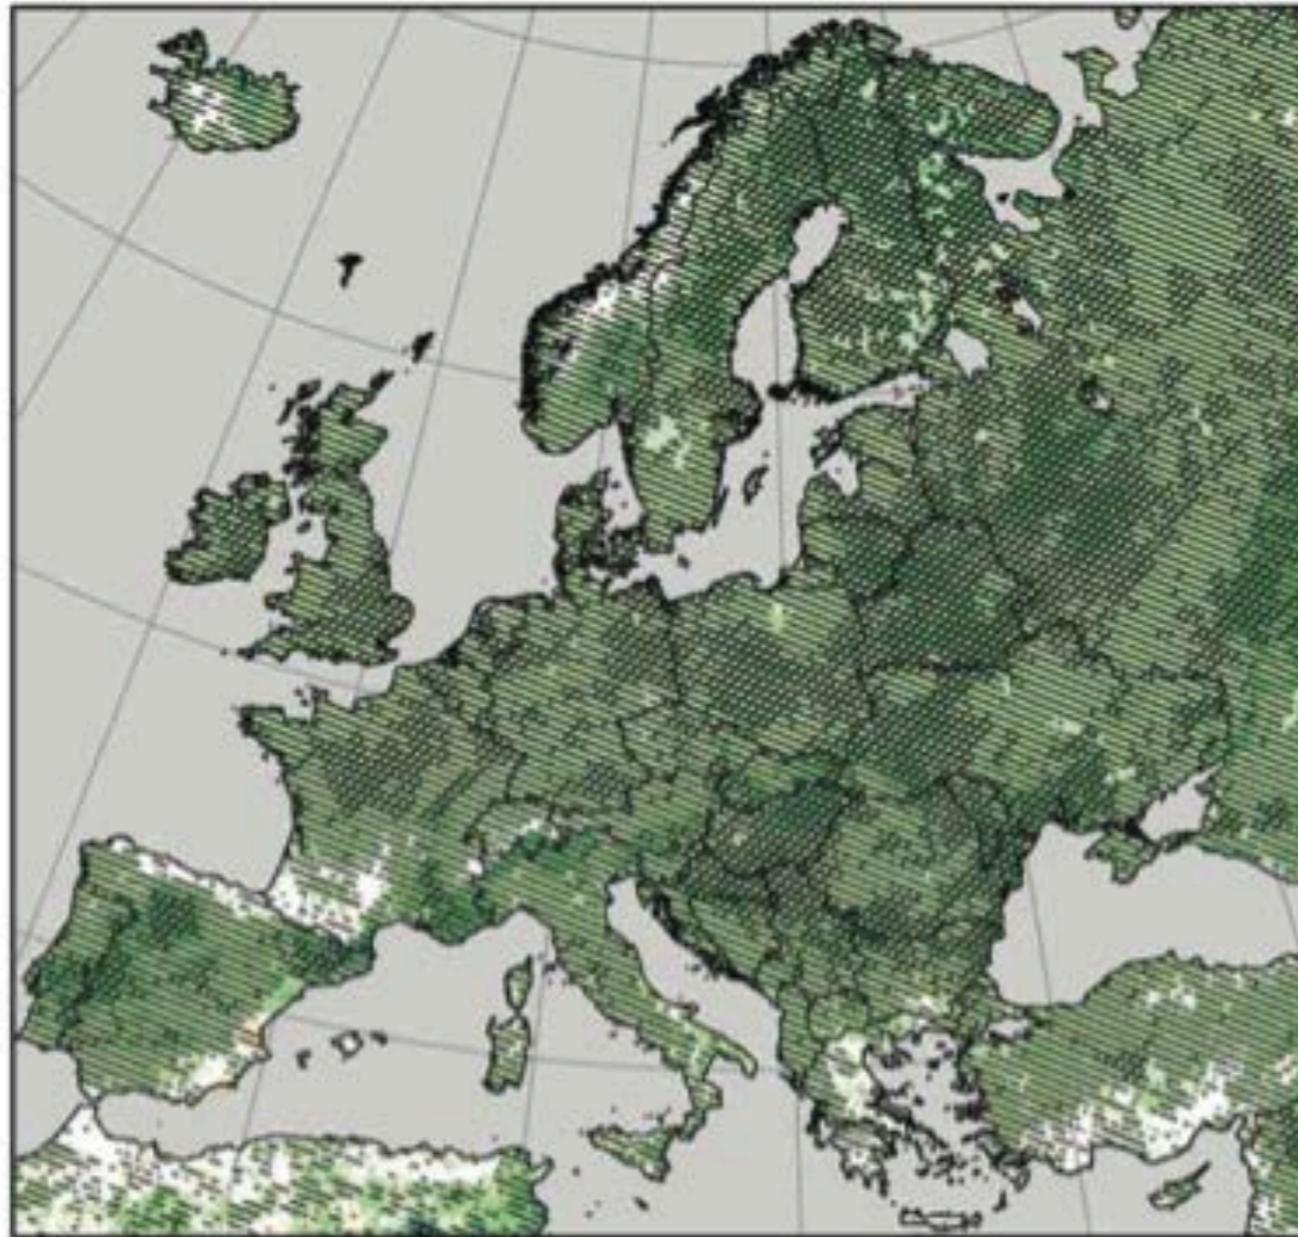

# North Europe - Map of temperature changes: 2081–2100 with respect to 1986–2005 in the RCP8.5 scenario (annual)

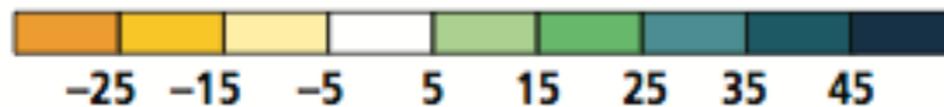

# DJF seasonal changes in heavy precipitation (%), 2071-2100 compared to 1971-2000

# Urgentie

@JPvanYpersele

# Potential Impacts of Climate Change

Food and water shortages

Increased displacement of people

Increased poverty

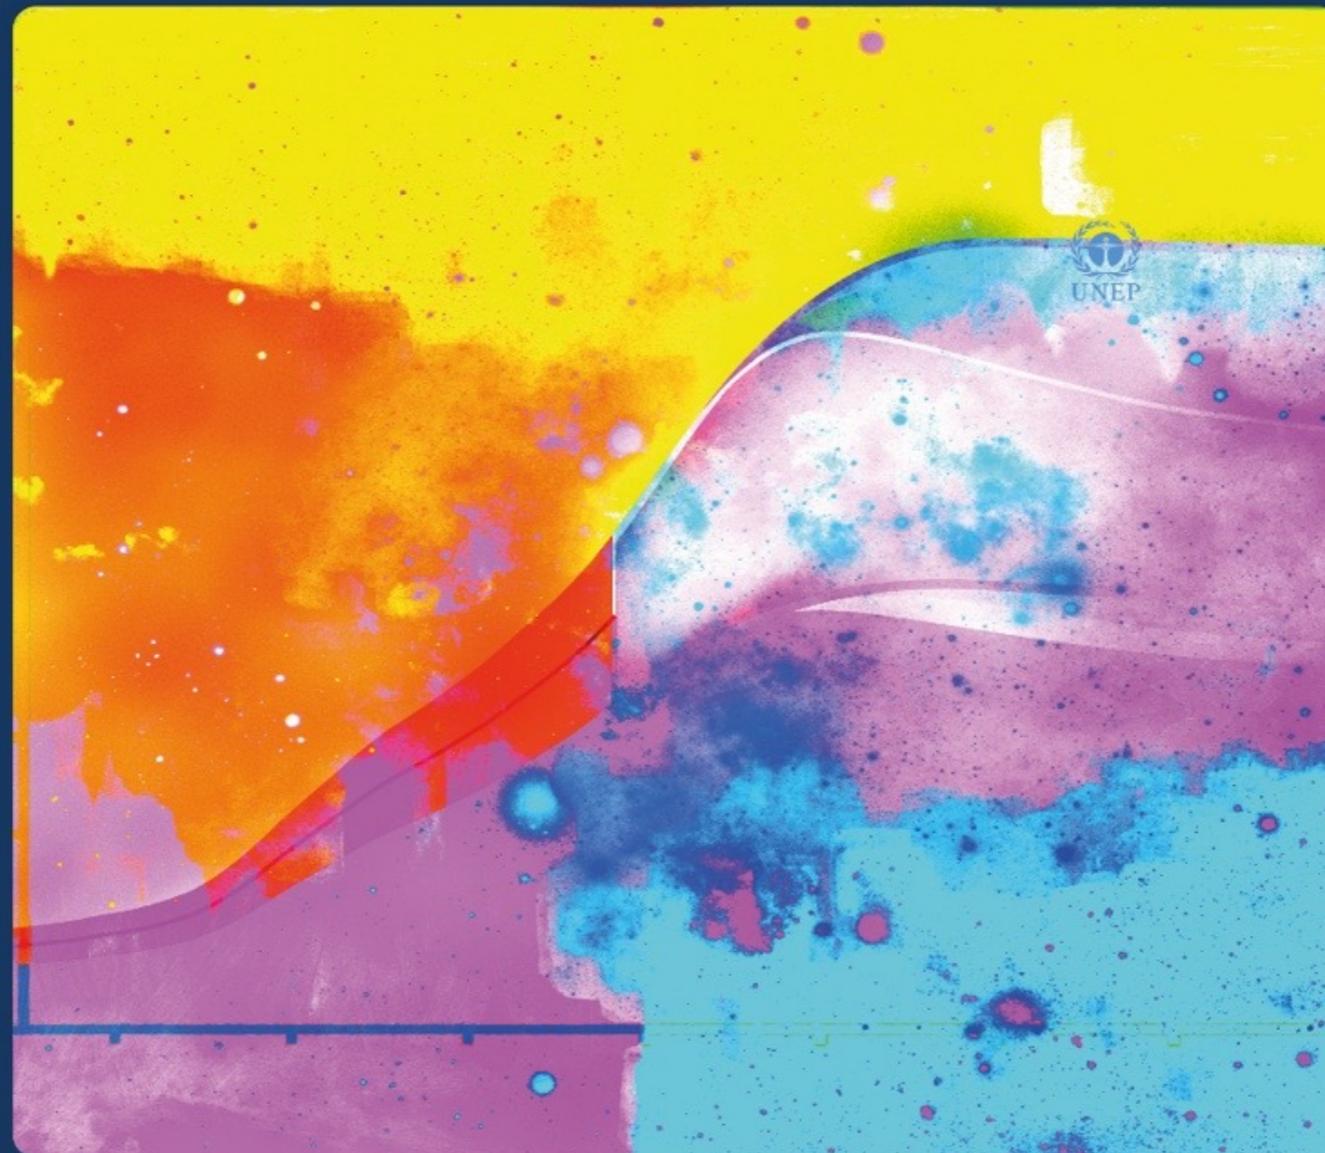

Coastal flooding

AR5 WGII SPM

# Global Warming of 1.5°C

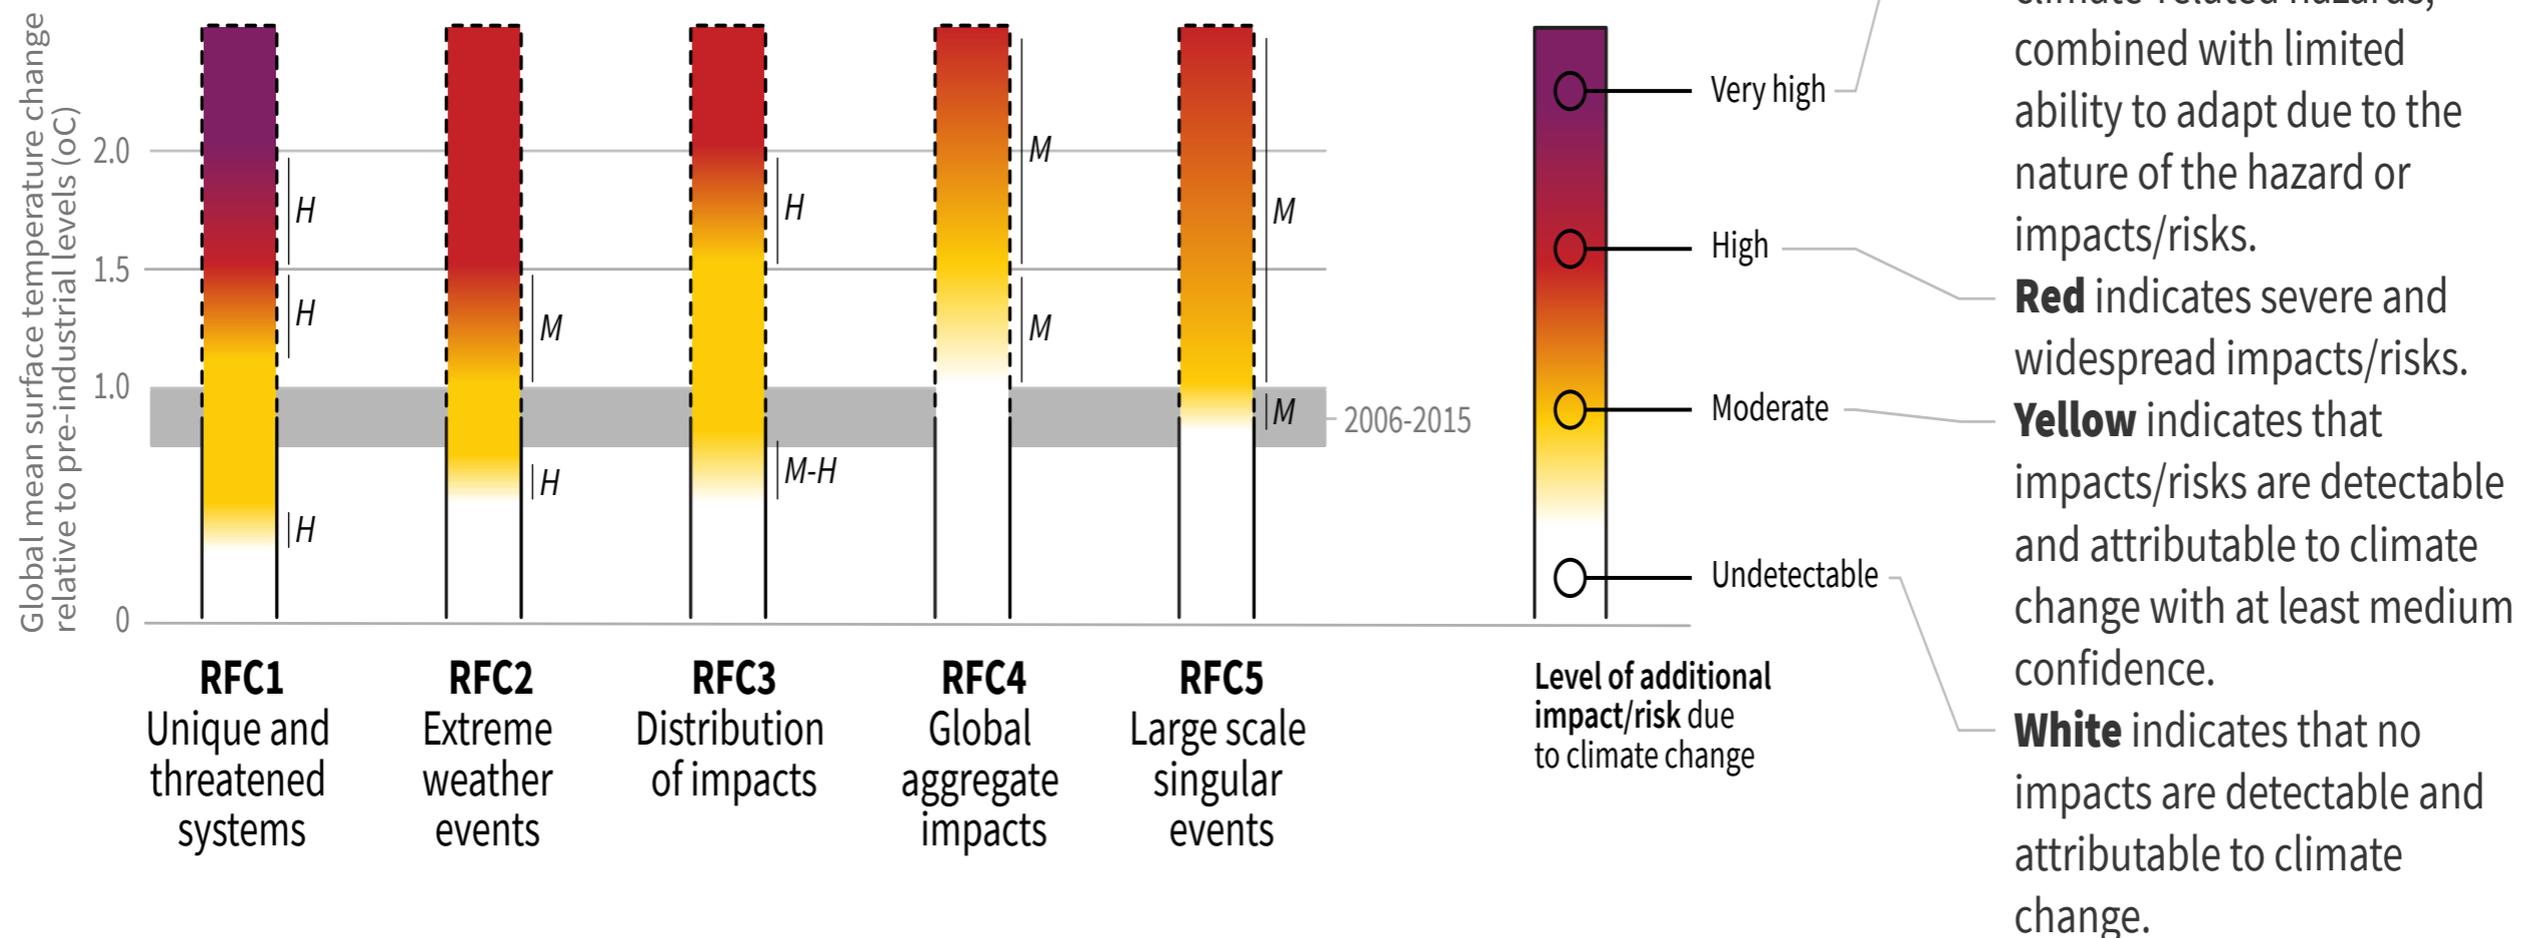

An IPCC special report on the impacts of global warming of 1.5°C above pre-industrial levels and related global greenhouse gas emission pathways, in the context of strengthening the global response to the threat of climate change, sustainable development, and efforts to eradicate poverty.

# How the level of global warming affects impacts and/or risks associated with the Reasons for Concern (RFCs) and selected natural, managed and human systems

Five Reasons For Concern (RFCs) illustrate the impacts and risks of different levels of global warming for people, economies and ecosystems across sectors and regions.

## Impacts and risks associated with the Reasons for Concern (RFCs)

# HALF A DEGREE OF WARMING MAKES A BIG DIFFERENCE:

EXPLAINING IPCC'S 1.5°C SPECIAL REPORT

	1.5°C	2°C	2°C IMPACTS
<b>EXTREME HEAT</b> Global population exposed to severe heat at least once every five years	14%	37%	2.6x WORSE
<b>SEA-ICE-FREE ARCTIC</b> Number of ice-free summers	AT LEAST 1 EVERY 100 YEARS	AT LEAST 1 EVERY 10 YEARS	10x WORSE
<b>SEA LEVEL RISE</b> Amount of sea level rise by 2100	0.40 METERS	0.46 METERS	.06M MORE
<b>SPECIES LOSS: VERTEBRATES</b> Vertebrates that lose at least half of their range	4%	8%	2x WORSE
<b>SPECIES LOSS: PLANTS</b> Plants that lose at least half of their range	8%	16%	2x WORSE
<b>SPECIES LOSS: INSECTS</b> Insects that lose at least half of their range	6%	18%	3x WORSE
<b>ECOSYSTEMS</b> Amount of Earth's land area where ecosystems will shift to a new biome	4%	13%	1.86x WORSE
<b>PERMAFROST</b> Amount of Arctic permafrost that will thaw	4.8 MILLION KM <sup>2</sup>	6.6 MILLION KM <sup>2</sup>	38% WORSE
<b>CROP YIELDS</b> Reduction in maize harvests in tropics	3%	7%	2.3x WORSE
<b>CORAL REEFS</b> Further decline in coral reefs	70-90%	99%	UP TO 29% WORSE
<b>FISHERIES</b> Decline in marine fisheries	1.5 MILLION TONNES	3 MILLION TONNES	2x WORSE

## Global emissions pathway characteristics

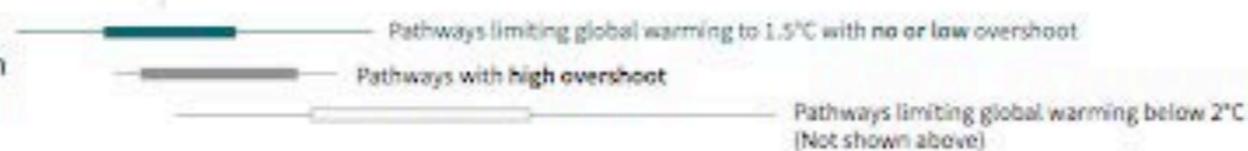

General characteristics of the evolution of anthropogenic net emissions of CO<sub>2</sub>, and total emissions of methane, black carbon, and nitrous oxide in model pathways that limit global warming to 1.5°C with no or limited overshoot. Net emissions are defined as anthropogenic emissions reduced by anthropogenic removals. Reductions in net emissions can be achieved through different portfolios of mitigation measures illustrated in Figure SPM3B.

### Global total net CO<sub>2</sub> emissions

#### Timing of net zero CO<sub>2</sub>

Line widths depict the 5-95th percentile and the 25-75th percentile of scenarios

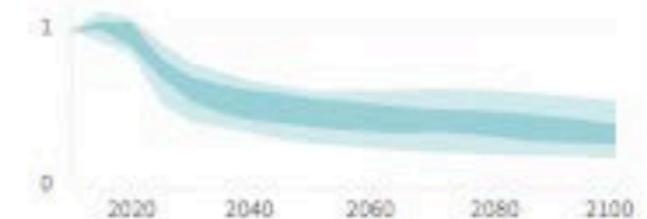

Source: IPCC Special Report on Global Warming of 1.5°C

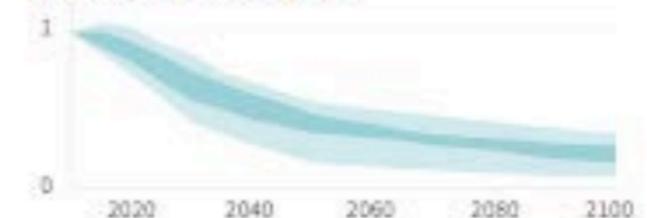

### Non-CO<sub>2</sub> emissions relative to 2010

Emissions of non-CO<sub>2</sub> forcers are also reduced or limited in pathways limiting global warming to 1.5°C with **no or limited overshoot**, but they do not reach zero globally.

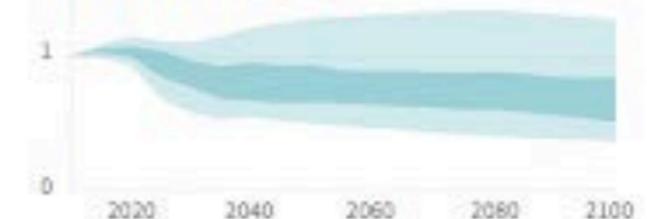

#### Methane emissions

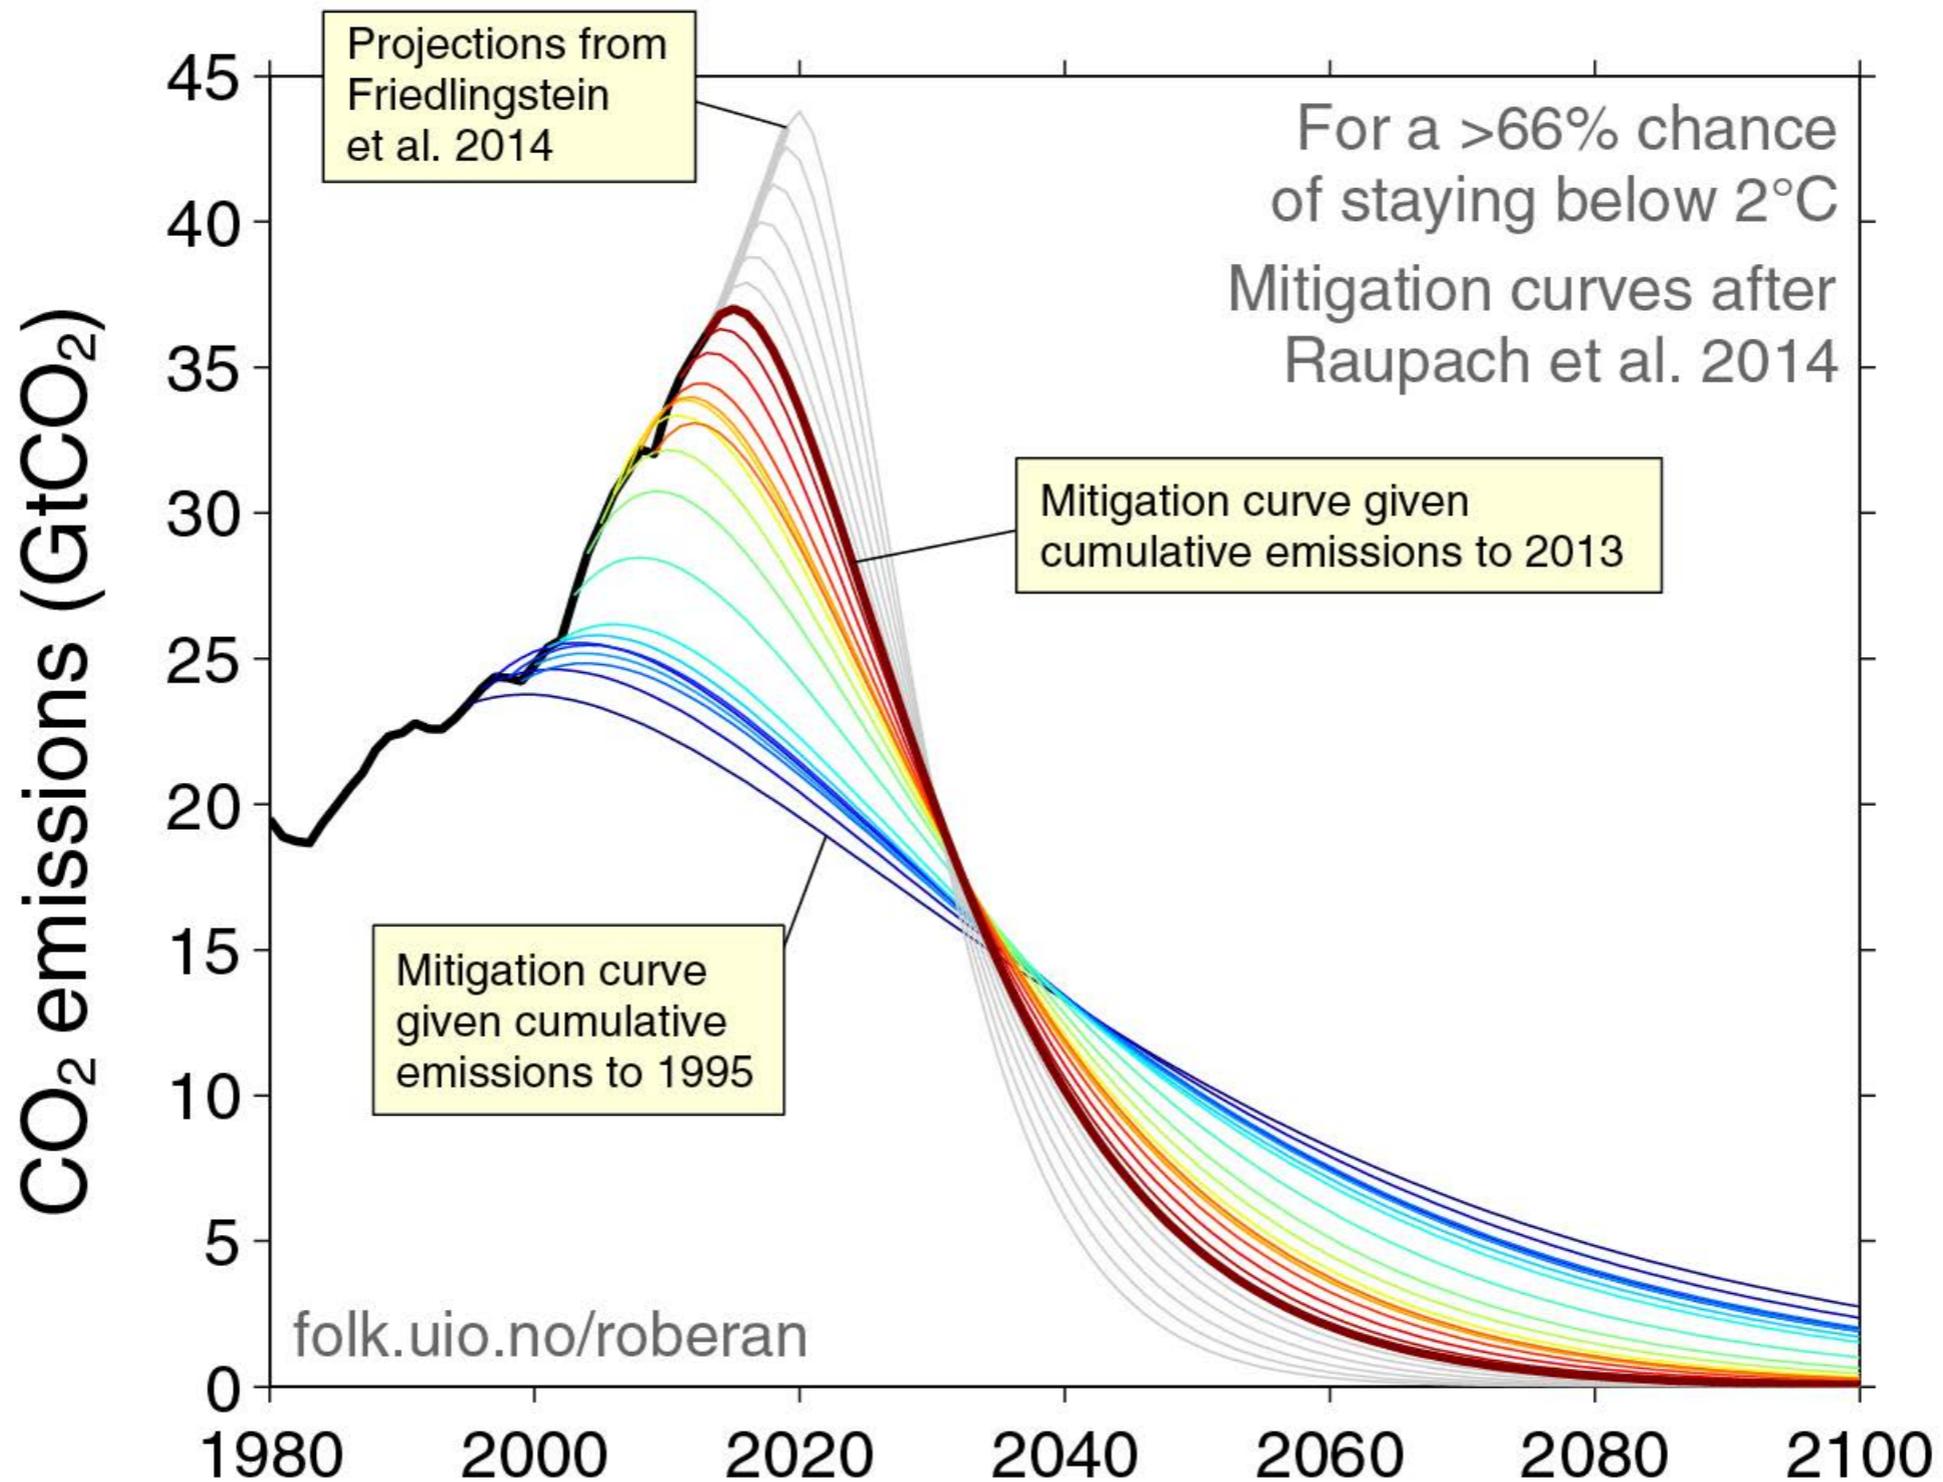

#### Black carbon emissions

#### Nitrous oxide emissions

# Limiting warming becomes much more difficult when the peak happens later

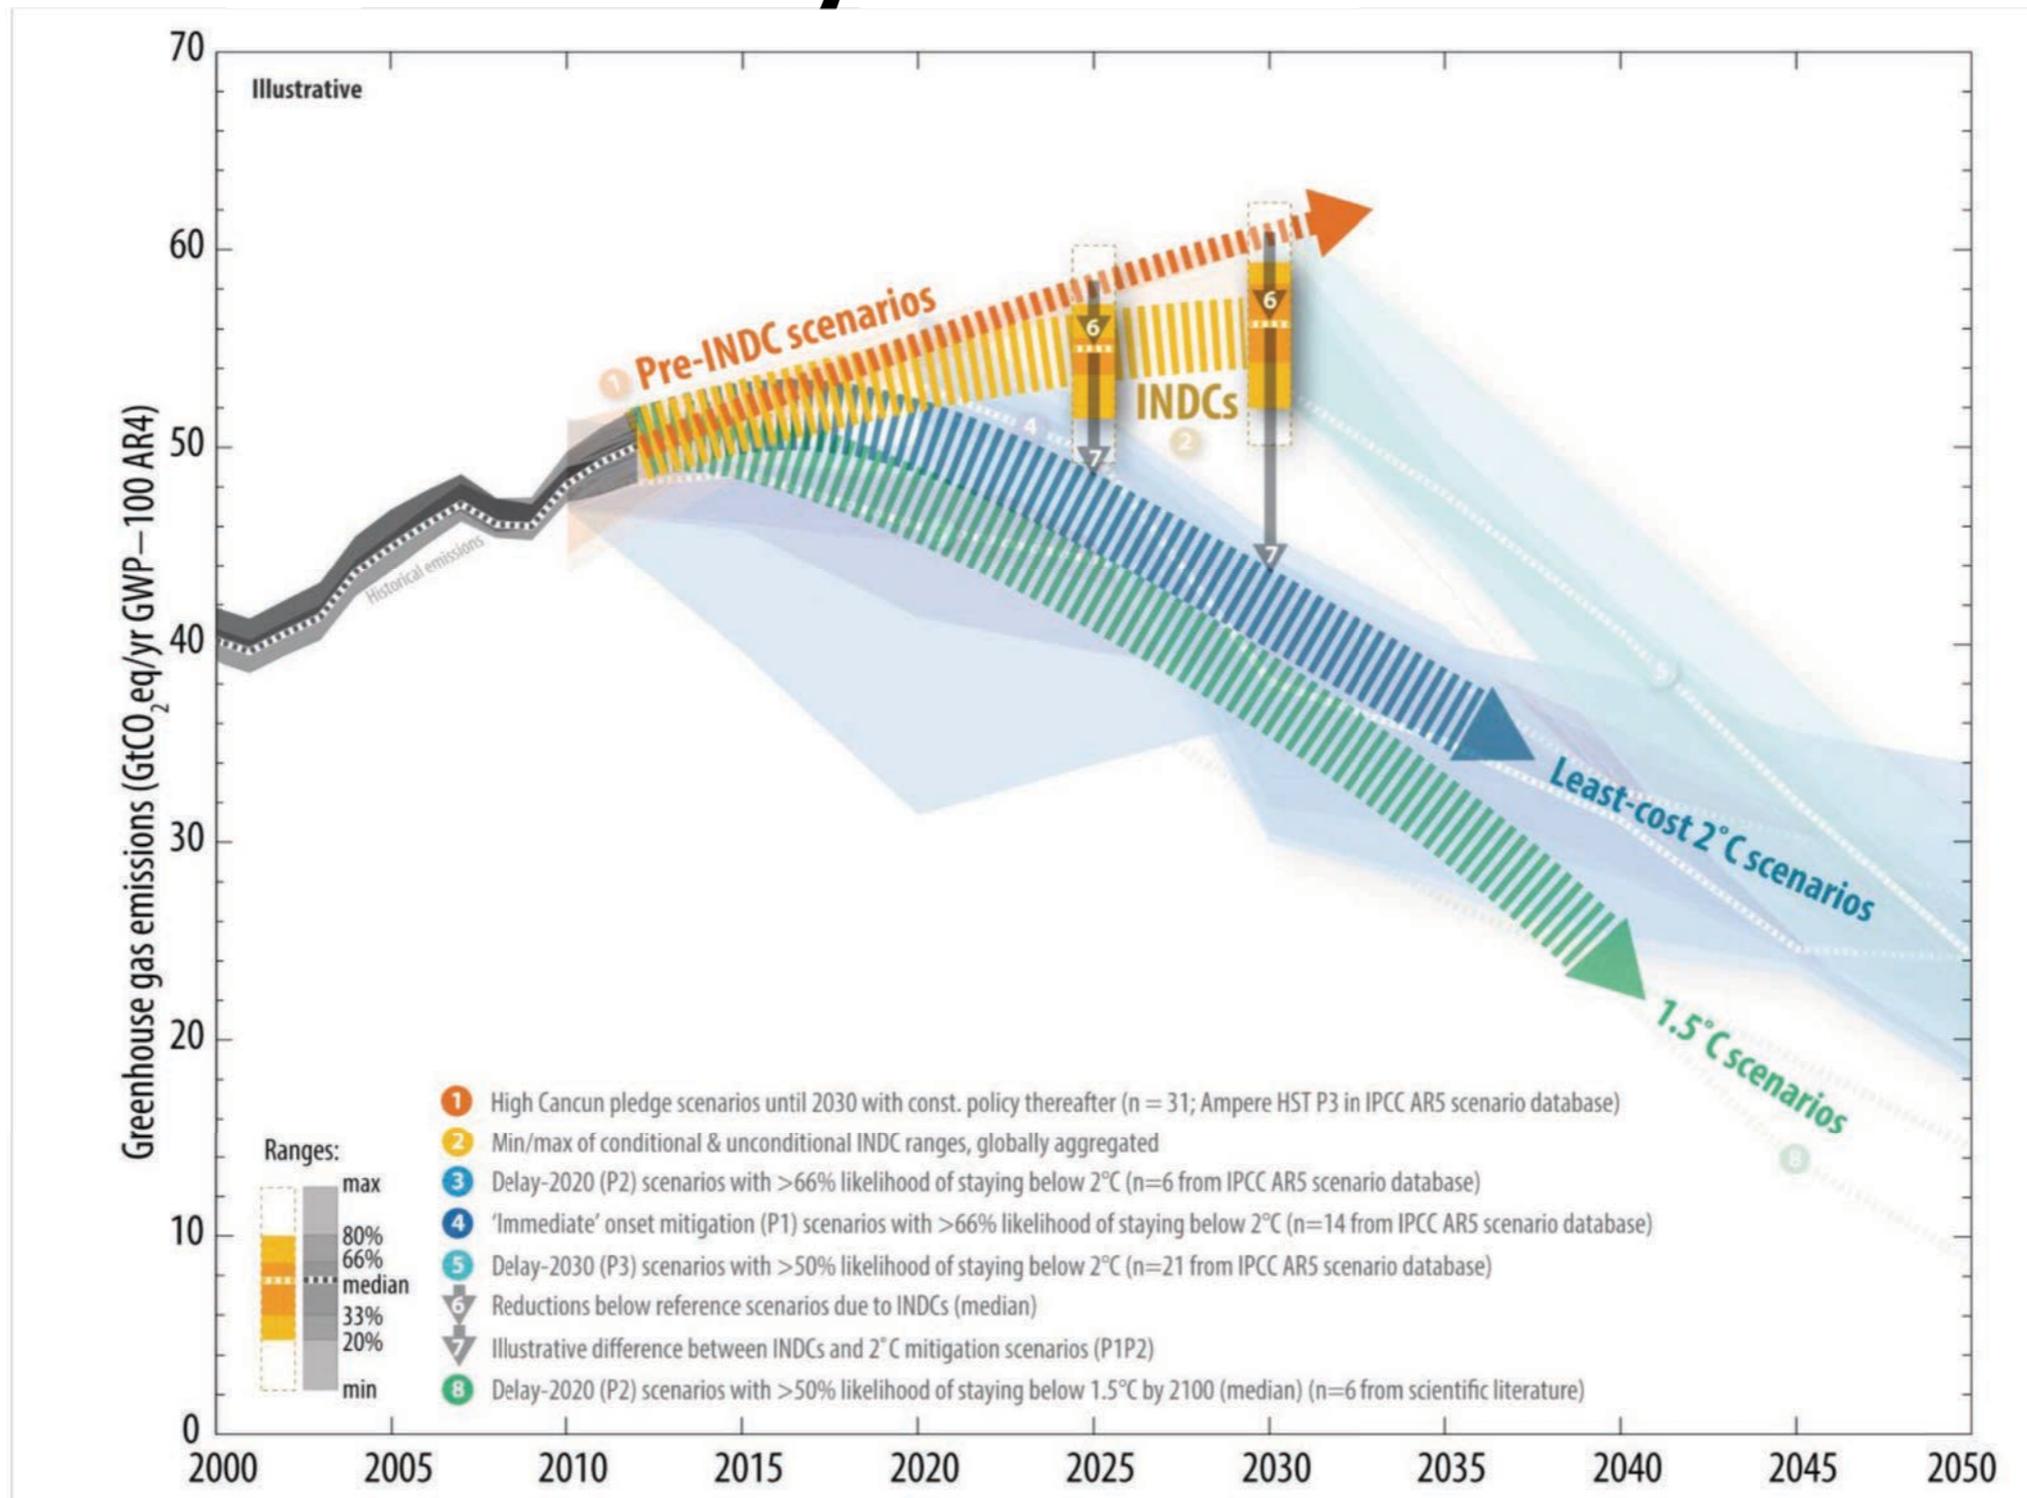

Source and details:

[http://folk.uio.no/roberan/t/global\\_mitigation\\_curves.shtml](http://folk.uio.no/roberan/t/global_mitigation_curves.shtml)

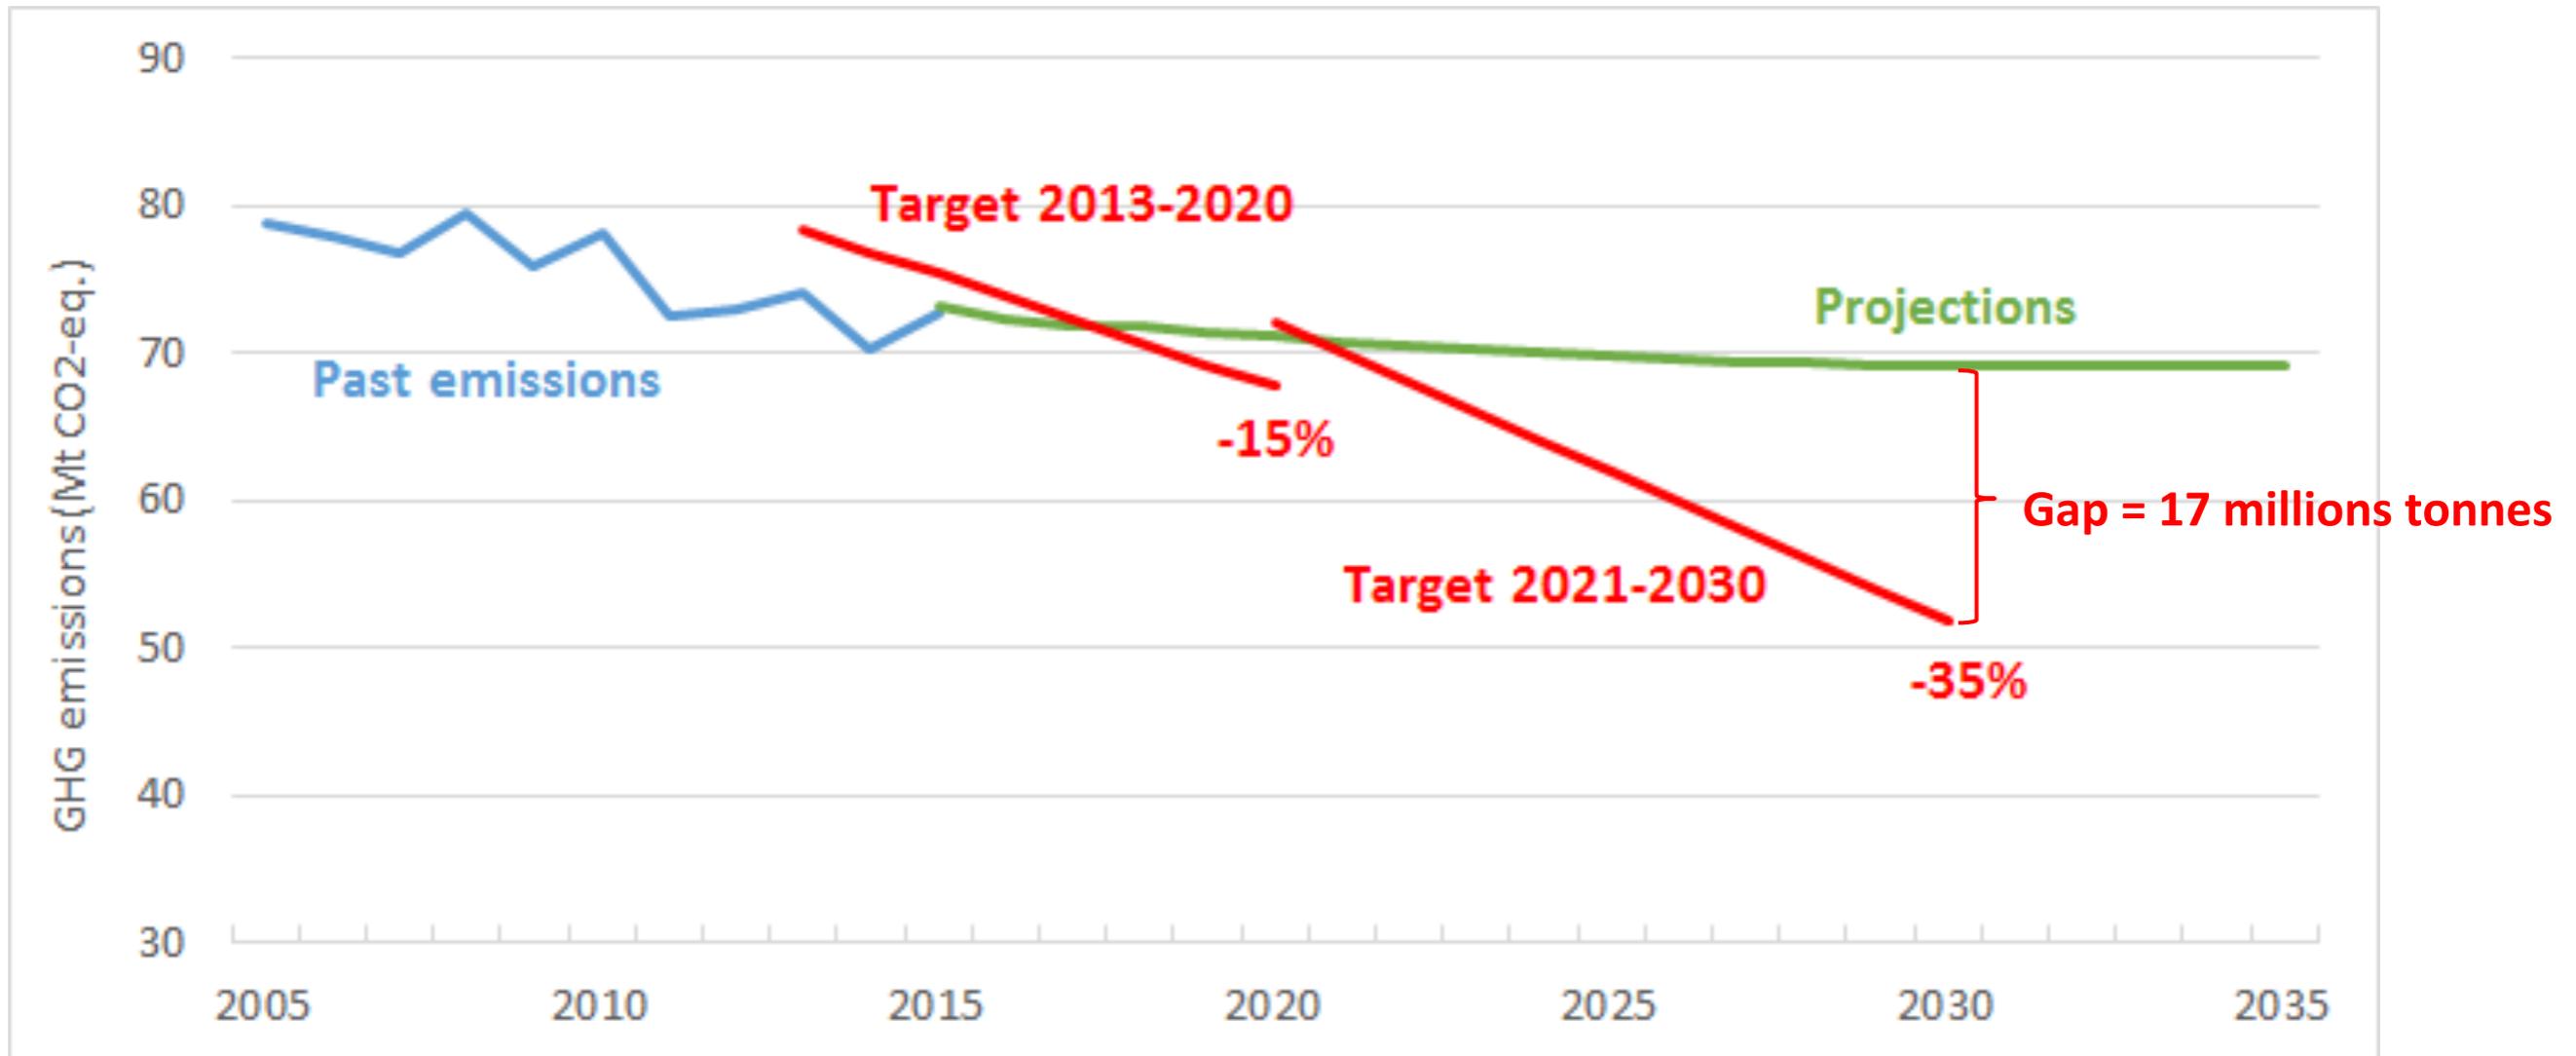

# Greenhouse gas emissions pathways

- To limit warming to 1.5° C, CO<sub>2</sub> emissions fall by about 45% by 2030 (from 2010 levels)
  - Compared to 20% for 2° C
- To limit warming to 1.5° C, CO<sub>2</sub> emissions would need to reach 'net zero' around 2050
  - Compared to around 2075 for 2° C
- Reducing non-CO<sub>2</sub> emissions would have direct and immediate health benefits

# Comparison of global emission levels in 2025 and 2030 resulting from the implementation of the intended nationally determined contributions

# OBJECTIFS DE LA BELGIQUE DANS LE CADRE EUROPÉEN

**Hoop**

@JPvanYpersele

# I want you to panic... and act

“I don’t want your hope. I don’t want you to be hopeful. I want you to panic ... and act as if the house was on fire. ”

**Greta Thunberg**  
Environmental Activist

WORLD  
ECONOMIC  
FORUM

- **Many scenario studies confirm that it is technically and economically feasible to keep the warming below 2° C, with more than 66% probability (“likely chance”). This would imply limiting atmospheric concentrations to 450 ppm CO<sub>2</sub>-eq by 2100.**
- **Such scenarios for an above 66% chance of staying below 2° C imply reducing by 40 to 70% global GHG emissions compared to 2010 by mid-century, and reach **Zero** or negative emissions by 2100.**

# Mitigation Measures

More efficient use of energy

**Greater use of low-carbon and no-carbon energy**

- Many of these technologies exist today
- But worldwide investment in **research** in support of GHG mitigation is small...

**Improved carbon sinks**

- **Reduced deforestation** and improved forest management and planting of new forests
- **Bio-energy with carbon capture and storage**

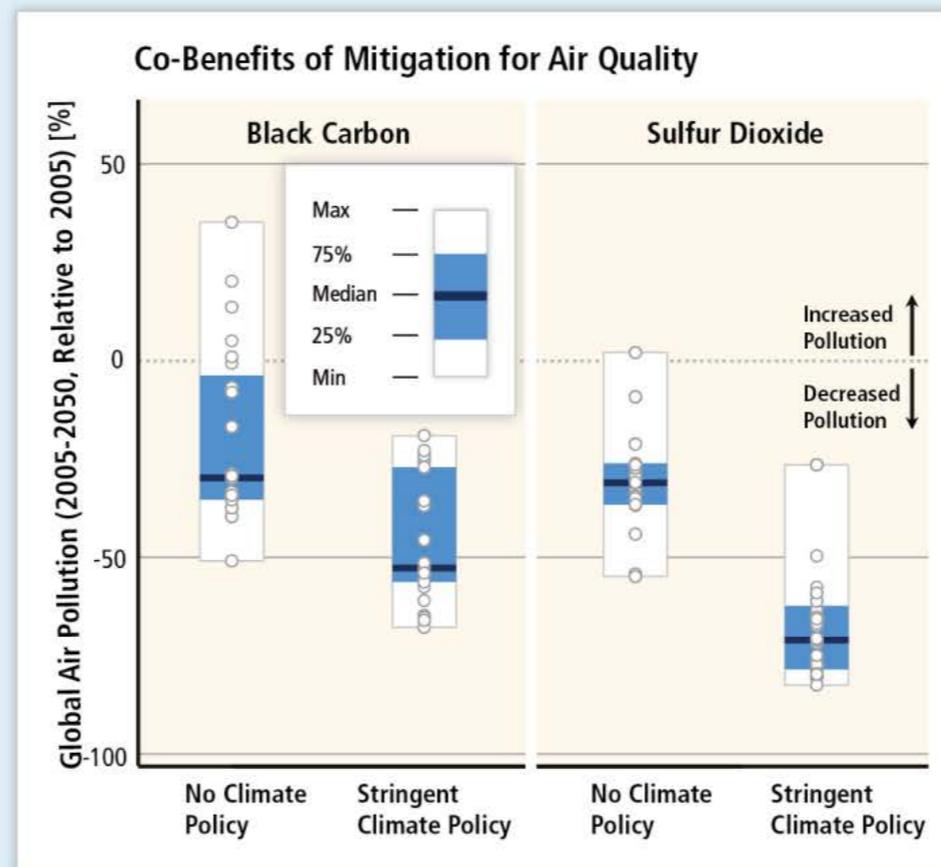

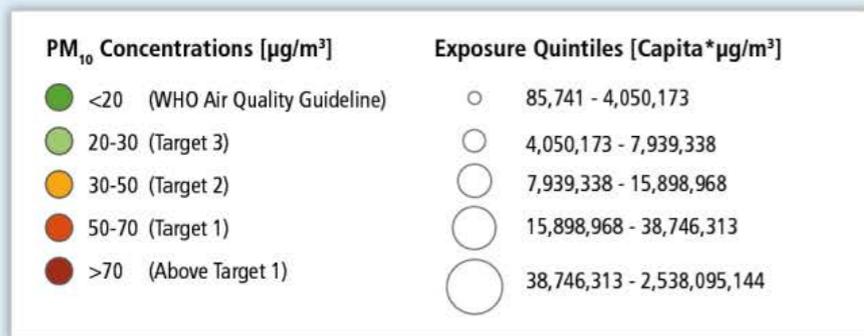

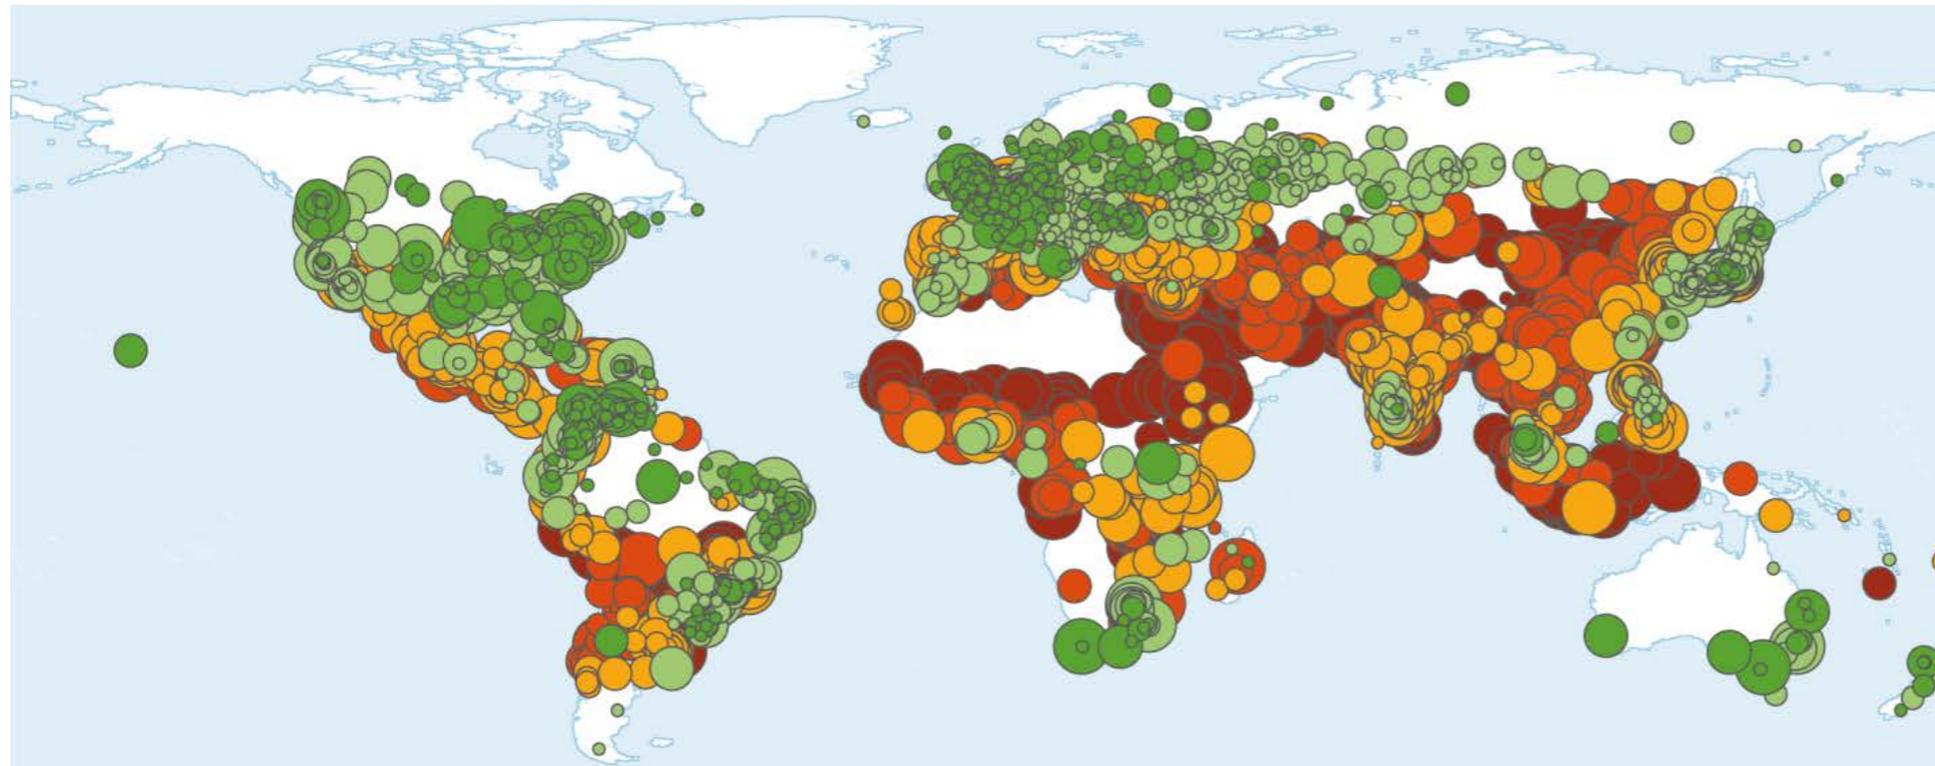

Lifestyle and behavioural changes

AR5 WGIII SPM

- **Substantial reductions in emissions would require large changes in investment patterns e.g., from 2010 to 2029, in billions US dollars/year:**

(mean numbers rounded, IPCC AR5 WGIII Fig SPM 9)

- **energy efficiency: +330**
- **renewables: + 90**
- **power plants w/ CCS: + 40**
- **nuclear: + 40**
- **power plants w/o CCS: - 60**
- **fossil fuel extraction: - 120**

**Mitigation can result in large co-benefits for human health and other societal goals.**

# SUSTAINABLE DEVELOPMENT GOALS

# Indicative linkages between mitigation options and sustainable development using SDGs

(The linkages do not show costs and benefits)

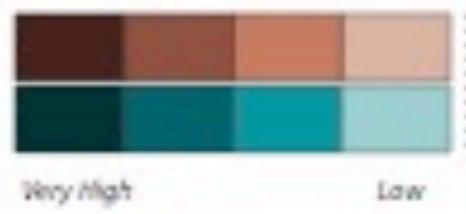

Mitigation options deployed in each sector can be associated with potential positive effects (synergies) or negative effects (trade-offs) with the Sustainable Development Goals (SDGs). The degree to which this potential is realized will depend on the selected portfolio of mitigation options, mitigation policy design, and local circumstances and context. Particularly in the energy-demand sector, the potential for synergies is larger than for trade-offs. The bars group individually assessed options by level of confidence and take into account the relative strength of the assessed mitigation-SDG connections.

Length shows strength of connection

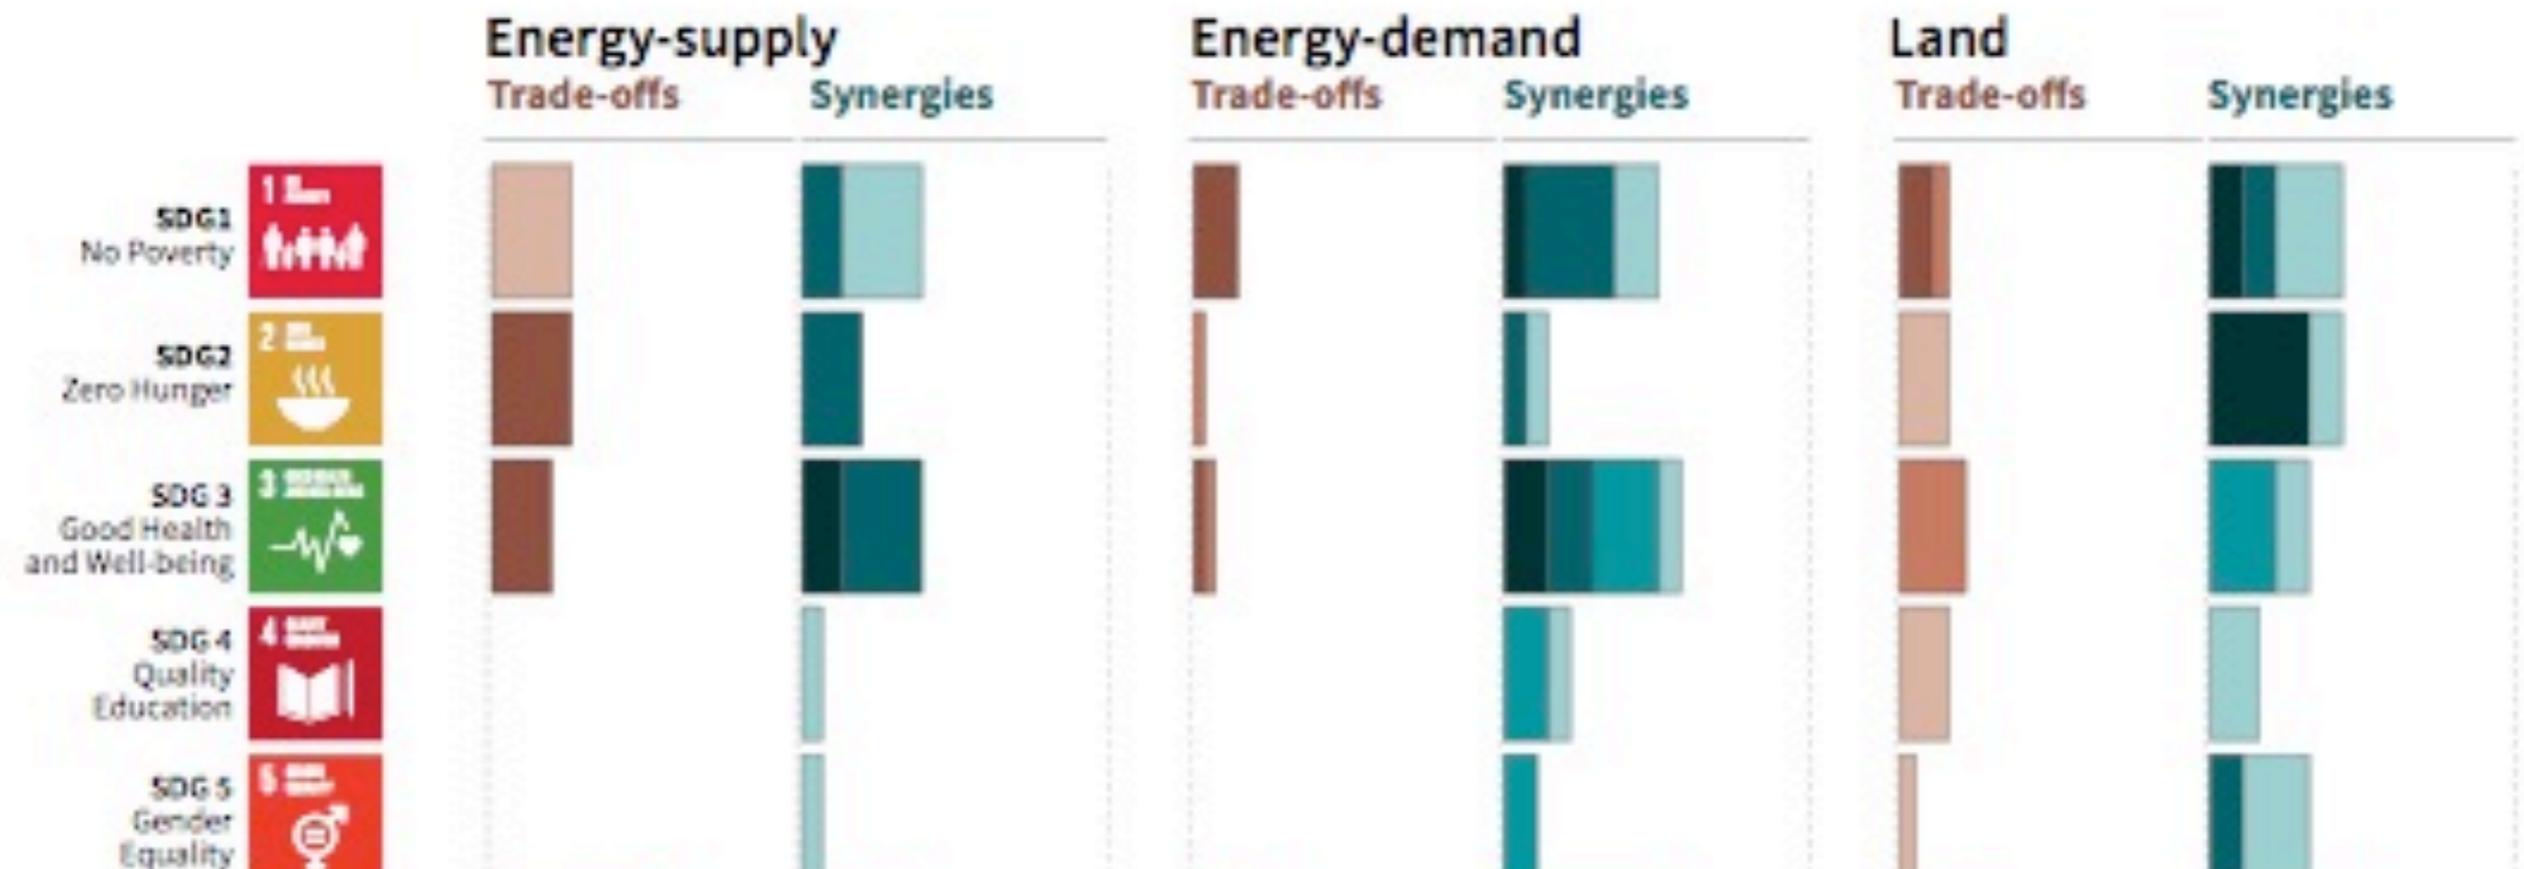

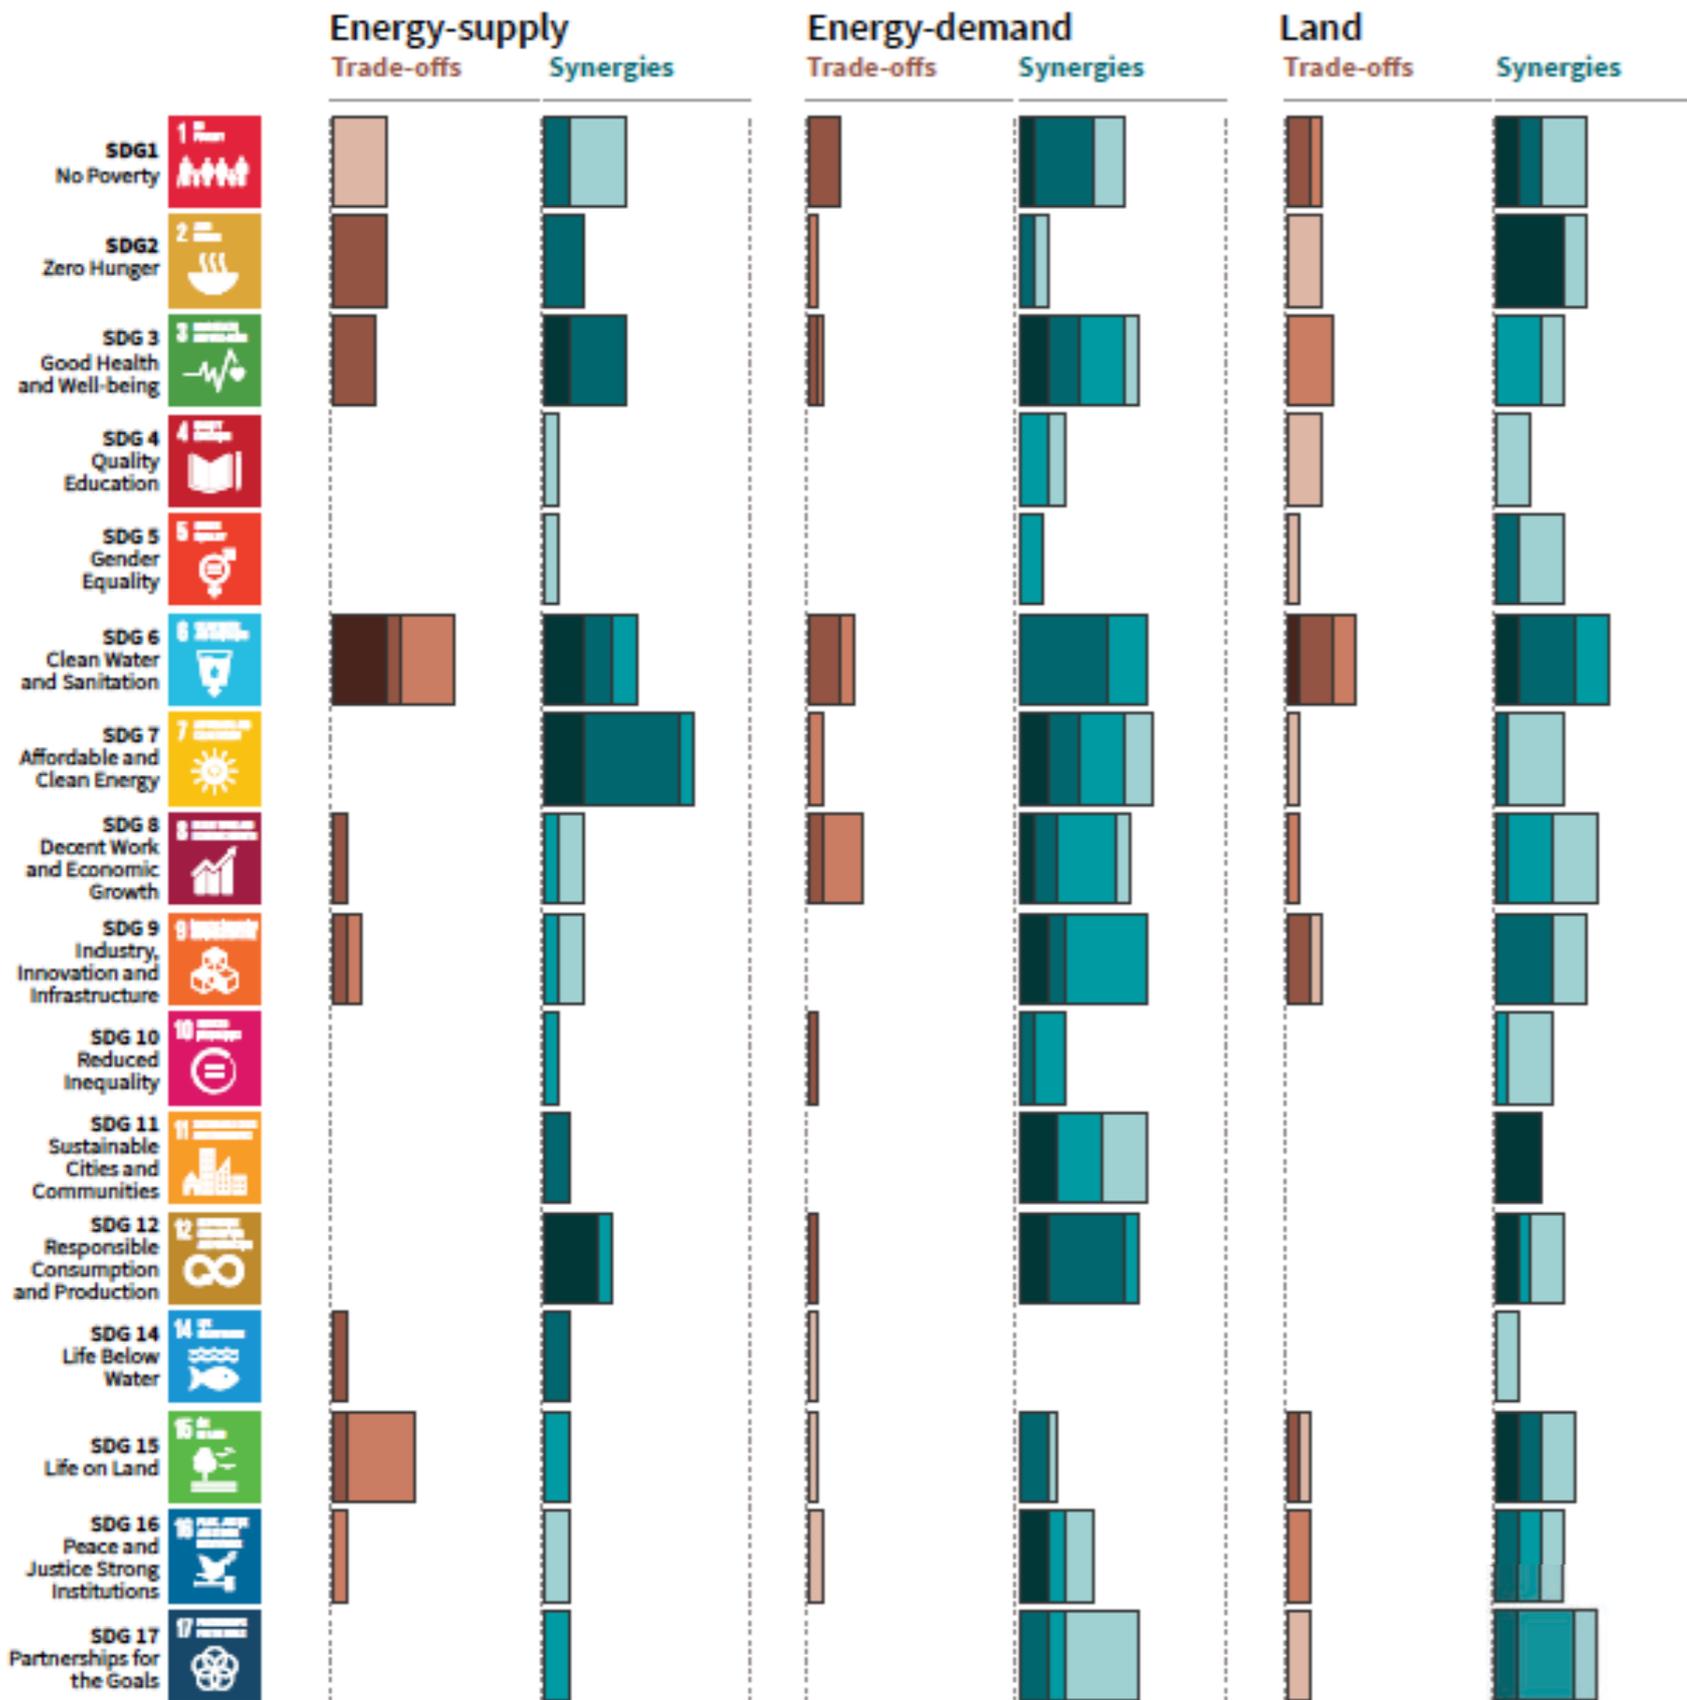

The overall size of the coloured bars depict the relative for synergies and trade-offs between the sectoral mitigation options and the SDGs.

Shades show level of confidence

The shades depict the level of confidence of the assessed potential for Trade-offs/Synergies.

**Length shows strength of connection**

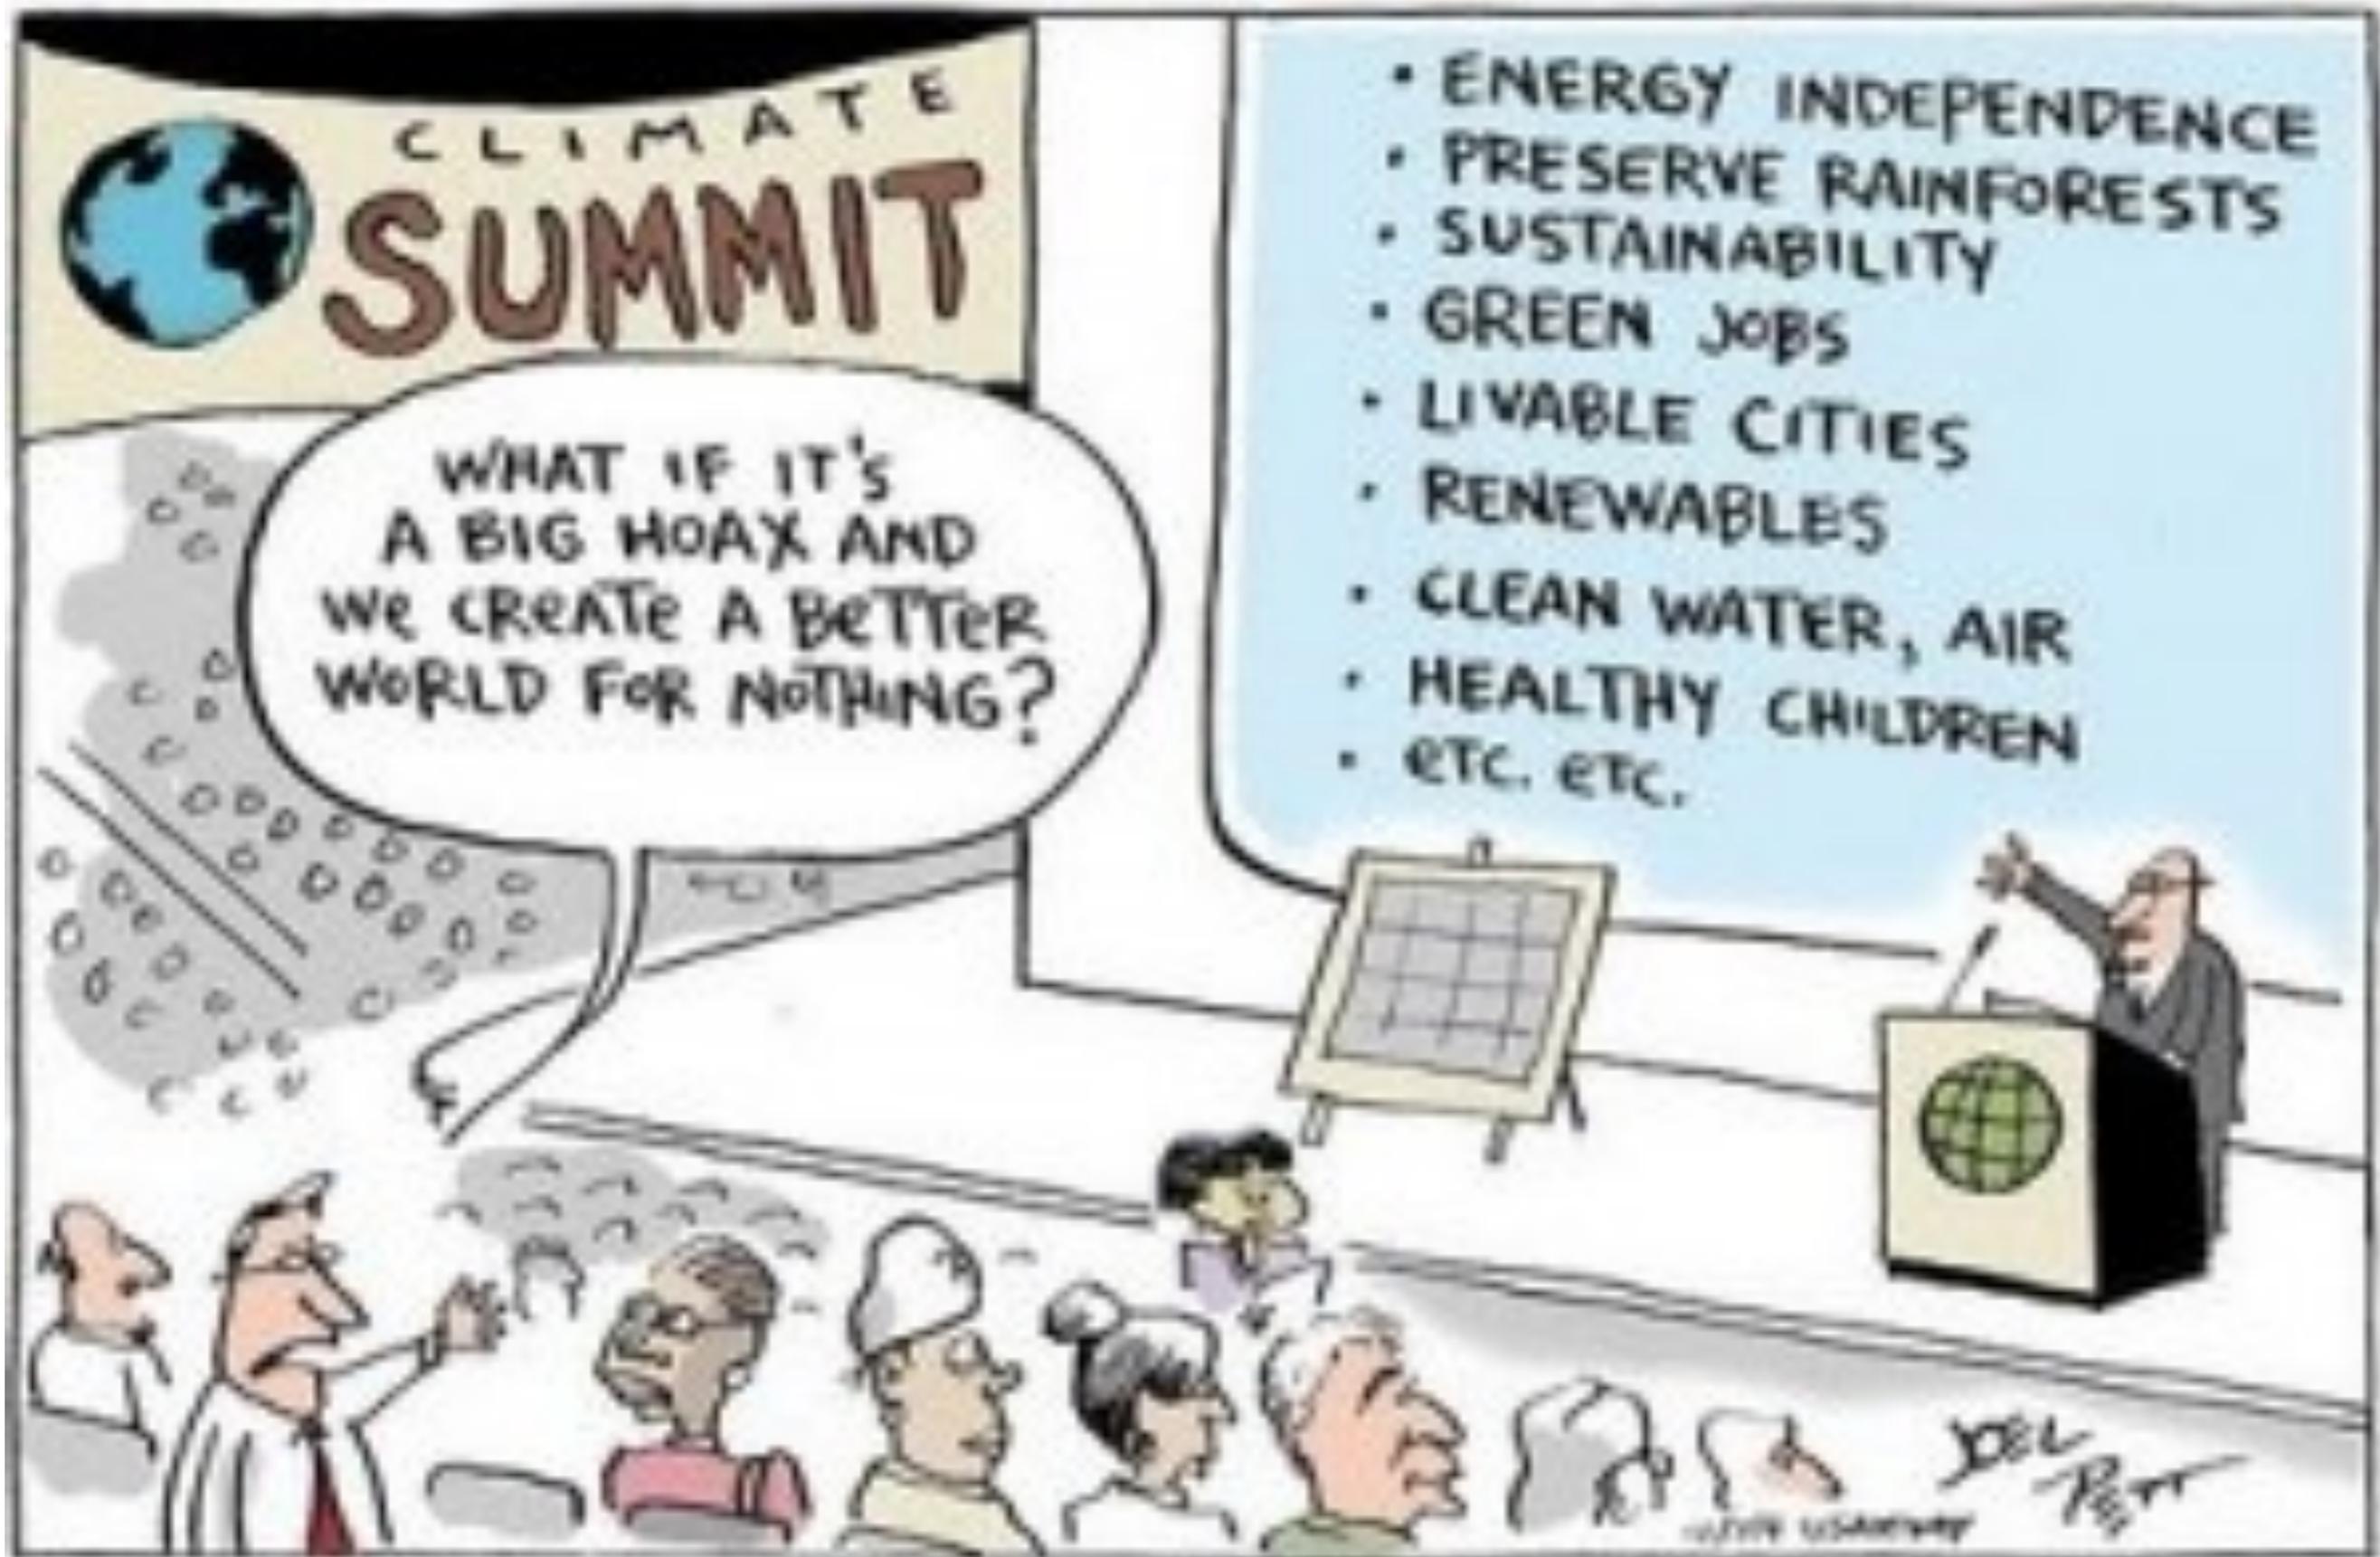

The overall size of the coloured bars depict the relative for synergies and trade-offs between the sectoral mitigation options and the SDGs.

**Shades show level of confidence**

The shades depict the level of confidence of the assessed potential for Trade-offs/Synergies.

Very High      Low
